

1st Edition

## **NOOK** HISTORY

In 1969, Joseph H. Nook Jr. founded Nook Industries, Inc., intent on becoming a global supplier of Linear Motion products. Ball screws, both rolled and ground, were the cornerstone products in the early 1970's, putting Nook Industries on the map as a successful business and a trusted company.

Through the years, Nook Industries has served as a leading manufacturer of engineered products. From the first ball screws

to the latest technologies, Nook Industries strives to provide customers with high quality products and engineered solutions.

Companies around the world depend on the quality products provided by Nook Industries to ensure their success. Nook Industries provides a complete line of linear motion products, serving a wide range of market segments.

## **NOOK** MARKET SEGMENTS SERVED

Aerospace  
Packaging  
Automotive  
Electronics

Transportation  
Tire Manufacture  
Entertainment  
Semiconductor

Military and Defense  
Factory Automation  
Pulp & Paper  
Steel

Chemical  
Medical & Diagnostic

## **NOOK** MISSION

Pairing traditional and proven design with the latest technology, Nook Industries manufactures products that customers value. The expansion of product lines and the development of application specific components and engineered systems have propelled Nook Industries to the forefront of the industry.

Nook Industries is committed to customer satisfaction and providing high-quality, high-value products that are delivered on time at a competitive price.

## PRECISION PROFILE BALL RAIL

### PRECISE LINEAR MOTION

- The reference face and four grooves are ground simultaneously by special grinding machines
- Simple construction of the runner block
- The rail's high degree of straightness enhances final installation accuracy

### FEATURES AND BENEFITS

#### Equal Load Carrying Capacity in Four Directions

- Steel bearing balls recirculate between the rail and the runner block and contact both surfaces at a 45° angle. Equal load can be applied bi-directionally in both horizontal and vertical axes. The Nook System is also capable of withstanding moment loads.

#### High Rigidity and High Moment Rigidity

- The benefits of full radius ball raceways are well established in the manufacture of precision ball screws. The circular shape provides ideal ball to ball raceway contact giving greater system rigidity
- The precise geometry of the square configuration of the ball raceway is ideal for preloading and provides high system rigidity
- A range of preloads are available depending upon the requirements for rigidity and load capacity
- The precise geometry of the square configuration of the ball raceway is ideal for preloading and provides high system rigidity

#### **Smooth Operation at Both High and Low Speeds**

- Precision ground full radius ball tracks provide smooth ball circulation and reduced friction
- The unique ball recirculation design permits stable, high speed travel

#### **Reliability**

- High quality materials are hardened by an advanced heat treatment system resulting in increased durability and performance
- Direct lubrication to ball grooves through a grease fitting insures adequate lubrication. The one-piece seal design retains lubricant and effectively protects against contamination
- Full radius ball raceways self-align to help absorb small mounting errors and distributes related stresses evenly
- The Nook Profile Rail design has been extensively tested to insure long reliable life

#### **Versatile Installation**

The compact design of Nook runner blocks offers greater design flexibility and several methods of mounting compared to other linear guidance systems. Special retainers and recirculation tubes prevent balls from escaping when the runner block is removed from the rail. (remove slowly with no-load)

The combined effect of the features listed above results in the following advantages:

- (1) Improved working accuracy
- (2) Greater performance control at low speed
- (3) Low temperature operation at high speed
- (4) Low friction
- (5) Reduced machining and assembly costs
- (6) Easy maintenance

## PROFILE BALL RAIL

### RUNNER BLOCK TYPES

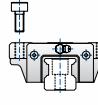

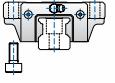

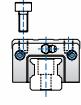

Nook Precision Profile Rails are available in two designs. One design utilizes steel return tubes for ball recirculation (NH-TA, NH-TB, NH-TR) and the other utilizes a plastic end cap for ball recirculation (NH-LEA, NH-LEB, NH-LER, NH-EA, NH-EB, NH-ER, NU-ER, NU-SER).

The tube type recirculation system enables the carriage to be used for higher speed applications. The plastic end cap runner block is narrower in width than the return tube style block. Depending upon the requirements of height, loads, mounting holes, etc. the users may choose from eight different options.

LOAD	BLOCK	RETURN SYSTEM	MOUNTING HOLES
H Heavy Load	Normal Runner Block	E End Cap Type	A Tapped Hole On Flange
U Heavy Load Compact	L Long Runner Block	T Tube Type	B Drilled Hole On Flange
N Medium Load	S Short Runner Block		R Tapped Hole Runner Block

### EXAMPLES:

N	H	25	E	A
	Heavy Load		Normal Runner Block	End Cap Type
N	U	30	S	E
	Heavy Load Compact		Short Runner Block	End Cap Type
				Tapped Hole Runner Block

CLASSIFICATION	ULTRA HEAVY LOAD TYPE - WITH LONG RUNNER BLOCK		
	NH-LEA	NH-LEB	NH-LER
Model			
Runner Block Mounting Direction			
Permissible Speed (m/min)	120	120	120
Accuracy Grade (C1=precision, C7=commercial)	C001-C7	C001-C7	C001-C7

**Coefficient of friction:** 0.005 max (rolling)

**Lubrication:** Lithium based grease. (Lubricate every six months or after every 100 Km of travel)

**Heat resistance:** 80°C (100°C with special insulation)

**Seals:** Other than standard equipped seals, there are bellows, cap plugs and scrapers available as options

**Corrosion resistance:** Hard chrome plating, RAYDENT™ coating and black chrome plating available as options

## REFERENCE NUMBER SYSTEM

The following numbers are used to reference the type of Nook Precision Profile Rail Systems.

When placing an order, please specify the numbers by referring to the following guide.

### ASSEMBLY

#### MODEL NO.

#### NUMBER OF RUNNER BLOCKS ON RAIL

One runner block = B1 Two runner blocks = B2

#### PRELOAD TYPE

#### LENGTH OF RAIL (mm)

#### ACCURACY GRADE

Stocked accuracy is C5

#### NUMBER OF RAILS USED IN PARALLEL ON THE SAME PLANE

One rail = W1 Two rails = W2

#### MODIFIER LIST

J = Butt-jointing rail

S = Standard, no additional description required

G = Customer designated lubricant

M = Modified, additional description required

I = Attached inspection report

C = Chrome surface treatment is applied to the casing and track rail

CR = Chrome surface treatment is applied to the track rail

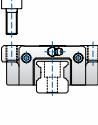

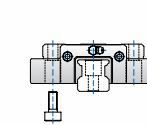

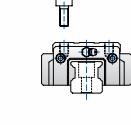

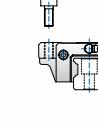

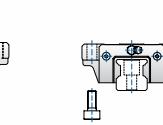

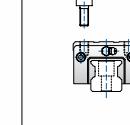

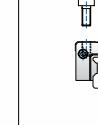

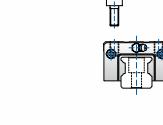

### RAIL ONLY

#### NH45PR - 1500 C3

#### MODEL NO.

#### LENGTH OF RAIL (mm)

#### ACCURACY GRADE

	HEAVY LOAD TYPE						MEDIUM LOAD TYPE	
	High Speed			Flange Type		Narrow Width	Compact High Rigidity

● Very Low

## ACCURACY STANDARDS & RECOMMENDATIONS

Nook Precision Profile Rail Systems are available in six standard classes. The selected accuracy grade should match the positioning accuracy and parallelism requirements of the machines.

The grade of the Profile Rail System should be matched to the ball screw if used.

	ACCURACY STANDARDS					
Rail Accuracy Grade	C001 Ultra Precision	C01 Super Precision	C1 Precision	C3 High Precision	C5* Standard Precision	C7 Commercial Precision
Type H Accuracy	●	●	●	●	●	●
Type U Accuracy	●	●	●	●	●	●

## ACCURACY

Please select the most suitable grade of Nook Precision Profile Rail System for your application. For accuracy requirements beyond the tolerances indicated or for any special requirements, please contact Nook application engineers.

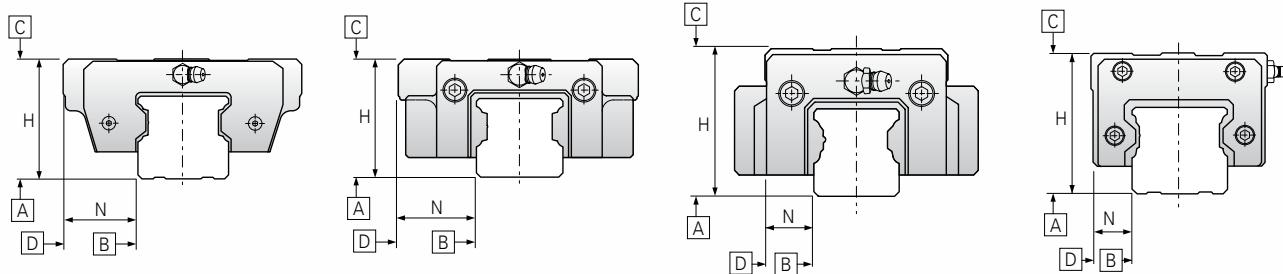

### RUNNING PARALLELISM

Running Parallelism is defined as the error in the parallelism between the datum planes of the rail and the runner block as the runner block is moved along its entire travel length.

### DIFFERENCES IN HEIGHT "H"

This defines the difference between the maximum and minimum heights "H" of the runner blocks that are mounted on the same rail. (See FIG. 1)

FIG. 1

Parallelism of plane **C** to datum plane **A**

Parallelism of plane **D** to datum plane **B**

### PARALLELISM

Rail Accuracy Grade		CO01	CO1	C1	C3	C5*	C7
Rail Length Min (mm)	Max (mm)	Ultra Precision (µm)	Super Precision (µm)	Precision (µm)	High Precision (µm)	Standard Precision (µm)	Commercial Precision (µm)
—	<b>315</b>	1.5	2	2.5	8	16	52
<b>315</b>	<b>400</b>	2	2.5	3.5	10	20	57
<b>400</b>	<b>500</b>	2	3	4.5	11	24	63

<b>2,500</b>	<b>3,150</b>	6	10	18	30	60	210

See unit conversion on page 209.

\* Stocked Accuracy—C5

### RAIL LENGTH

The maximum lengths of rail for Nook Precision Profile Rails are shown in the table below. Longer lengths can be achieved by butt joining rails.

### MAXIMUM LENGTH OF RAIL TRACK

MODEL NO.	MAX. LENGTH
NH-15	3,000
NU-15	1,500
NH-20, 55, 65	3,000
NH-25 thru 45	4,000
NU-20 thru 55	3,000

Unit = mm

### RAIL STRAIGHTNESS

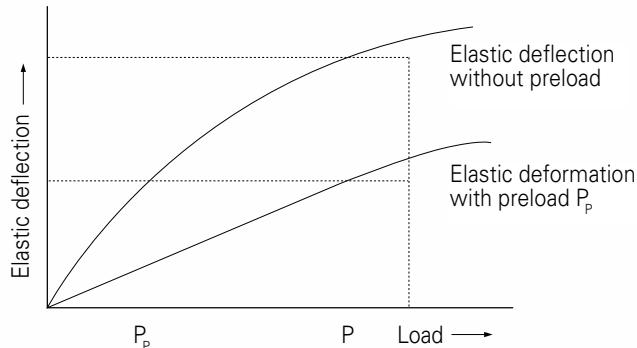

To obtain high accuracy guidance, the rail itself must be straight. It is very difficult to mount a distorted rail on a straight mounting surface. Nook rail manufacturing processes ensure straightness for ease of assembly and long life. Distortion free end cuts are achieved through an automated, wet, abrasive cut-off saw system.

## PRELOAD & RIGIDITY

For correct operation under complex loading conditions, the selection of a suitable preload for linear motion bearings is essential. For extended life and accuracy under conditions of vibration and shock, the best results are usually achieved by using Nook Precision Profile Rails with heavy preload.

In general, if preload is applied to the Nook Precision Profile Rails, rigidity of the Profile Rail will be doubled compared to that of a non-preloaded Profile Rail.

The preloaded condition is effective for operating loads of up to approximately 3 times the value of preload. Therefore, as a guide, one half to one third of the operating load should be considered for preload and specified according to tables below.

Standard preload (Unit = kgf)

RUNNER BLOCK & STYLE	PRELOAD								
	NH-L	NH-NU	NU-SER	T	TO*	T1	T2	T3	
				15	—	0	15	30	45
	15	20	—	—	0	25	50	75	
			—	—	0	30	60	90	
	20	25	—	—	0	40	80	120	
	25	—	—	—	0	50	100	150	
	25	30	—	—	0	55	110	165	
	30	—	—	—	0	70	140	20	
	30	35	—	—	0	80	160	240	
			—	—	0	95	190	285	
	35	—	—	—	0	110	220	330	
			—	—	0	120	240	360	
	35	—	—	—	0	135	270	405	
	45	—	—	—	0	180	360	540	
	45	—	—	—	0	210	420	630	
	55	—	—	—	0	270	540	810	
	55	—	—	—	0	310	620	930	
	65	—	—	—	0	420	840	1,260	
	65	—	—	—	0	520	1,040	1,560	

\* Stocked Preload-TO

See unit conversion on page 209.

### SELECTION OF PRELOAD

Preload	Conditions of use	Application
<b>T3 Heavy</b>	Heavy cutting or forming work with heavy impact and vibration.	• Machining center
<b>T2 Medium</b>	Overhung load or alternate load applied.	• Milling machines • Vertical axis of machine tools
<b>T2 Medium</b>	Medium cutting or forming light work with medium impact and vibration.	• Electrical discharge machines
<b>T1 Light</b>	Light overhung load or alternate load applied.	• Surface grinding machines • Robots. • Jig grinding machines • Laser processing machines • Printed circuit board drilling machines • High speed punching machines
<b>T1 Light</b>	Precise movement with very light vibration No overhung load or no measuring equipment alternate load applied.	• Precision positioning tables
<b>TO Very Light</b>		• Automatic tool changer for machining centers • Welding machines • Material feeding devices
<b>TO Very Light</b>	Extreme changes in temperature. High precision not required.	• Tool changers
<b>T Clearance</b>		• Material feeding devices • Plasma cutting machines

## LIFE

All of the following factors should be taken into consideration when selecting a Nook Precision Profile Rail System:

The rolling elements and raceways of a Rail System that supports a load are always subject to cyclic stress. Eventually, part of the raceway may spall due to metal fatigue. The life of a linear motion system is defined as the total distance of the travel reached by the time that first fatigue spalling occurs, either from a rolling element or raceway.

## DEFINITION OF RATED LOAD

- **Dynamic load ratings C**

C (kN) is the operating load which specifies 50km of travel.  
(1 kgf=9.81 Newtons=0.2248 lbf)

- **Static load ratings C<sub>0</sub>**

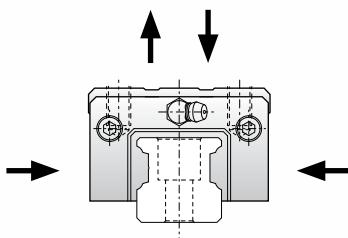

C<sub>0</sub> (kN) is the load that causes a permanent deformation equal to  $\frac{1}{10000}$  of the ball diameter at the contact point between the ball groove and the steel ball.

- **Static moment ratings M**

M (kN·m) is the moment which causes a permanent deformation equal to  $\frac{1}{10000}$  of the ball diameter at the contact point between the ball groove and the steel ball when a moment load is applied.

For C, C<sub>0</sub>, M of each model refer to dimensional table.

Nook Precision Profile Rails have the same dynamic load capacity in all four directions.

## STATIC SAFETY FACTOR

Generally, the maximum permitted static load on the runner block is equivalent to static load ratings C<sub>0</sub>. However, in repeated linear motion applications, unexpected load is caused by the inertia when the system starts or stops. Therefore, the safety factor f<sub>s</sub> should be calculated in order to determine the allowable load.

$$\frac{C_0}{P_0} \geq f_s$$

Where:

C<sub>0</sub> = static load ratings

P<sub>0</sub> = equivalent load (static load, impact load)

f<sub>s</sub> = static safety factor

The value of f<sub>s</sub> for general use is indicated in the table.

## STATIC SAFETY FACTOR

OPERATING CONDITION	Minimum f <sub>s</sub>
Normal operation	1~3
Smooth running required	3~4
Operation with impact or vibration	4~5

## DETERMINATION OF RATED FATIGUE LIFE

Dynamic load ratings C (kN), number of strokes per minute and rated fatigue life L (km) are related as follows:

$$L = 50 \times \left(\frac{C}{P}\right)^3$$

Where:

L = expected life

C = basic load ratings

P = equivalent load

Where the stroke s (m) and the number of cycles per minute n<sub>1</sub> (cpm) are constant, the rated fatigue life L<sub>h</sub> (hr) is calculated by the following formula.

$$L_h = \frac{50 \times 10^3}{120 \times l_s \times n_1} \times \left(\frac{C}{P}\right)^3$$

Where:

L<sub>h</sub> = expected Life (hr)

l<sub>s</sub> = stroke length (m)

n<sub>1</sub> = number of strokes per minute

## CALCULATION OF RUNNER BLOCK LOAD

### • Driving factor and contact factor

The load acting upon the runner block is the sum of all of the loads applied, such as the weight of the table, the cutting force and the inertia force caused by the change of speed or by heavy impact or vibration.

Loads other than the weight of the table are often difficult to calculate. If in doubt, the applied load should be multiplied by a driving factor  $f_d$  (table below) to give the effective external load.

### DRIVING FACTOR $F_d$

OPERATING CONDITION	$f_d$
Smooth running without impact. Speed under 15 m/min.	1.0 ~ 1.5
Running with light impact. Speed under 60 m/min.	1.5 ~ 2.0
Running with heavy impact. Speed over 60 m/min.	2.0 ~ 4.0

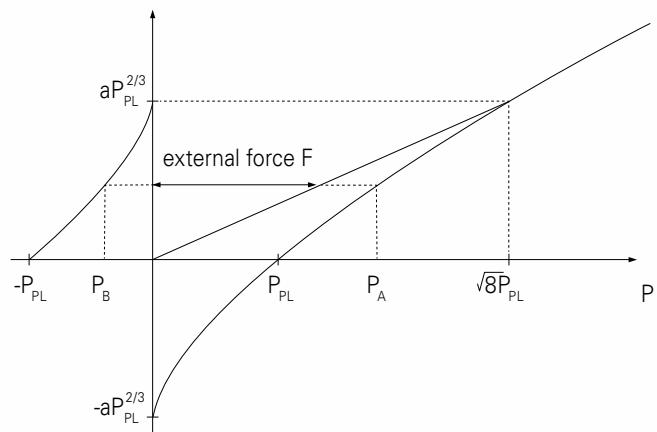

In most installations each rail is fitted with at least two runner blocks. The distribution of load across each runner block is very much influenced by the mounting accuracy or machining accuracy of the table. Therefore, the contact factor in the table below should be taken into account. Multiply the load by this factor.

### CONTACT FACTOR $f_c$

Number of runner blocks on one rail	$f_c$
1	1.00
2	0.86
3	0.74
4	0.66

### • Effect of preload on internal load of runner block

Internal load  $P_A$  is determined by external force  $F$  and preload of runner block  $P_{PL}$ .

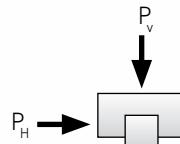

1) Where  $F \geq \sqrt{8} P_{PL}$   
internal load  $P_A = (\frac{F}{\sqrt{8} P_{PL}} + 1)$

2) Where  $F > \sqrt{8} P_{PL}$   
internal load  $P_A = F$

### • Resultant force of vertical load and horizontal load

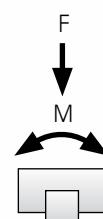

Resultant force of vertical load  $P_v$  and horizontal load  $P_h$  is determined as follows:

### • Resultant force of radial load and moment load

Resultant force of radial load  $F$  and moment load  $M$  is determined as follows.

$$P = F + Mx \frac{C_0}{M_0}$$

Where:

$C_0$  = rated static load

$M_0$  = rated static torque on M direction

See unit conversion on page 209.

## LIFE

### • Mean load vs. load variation

In applications where the load on to the runner block varies, mean load should be considered instead of discrete load variations  $P_1, P_2 \dots P_n$ .

1. For cases where the load and travel vary gradually:

$$P_e = \sqrt[3]{\frac{1}{L} (P_1^3 L_1 + P_2^3 L_2 + \dots + P_n^3 L_n)}$$

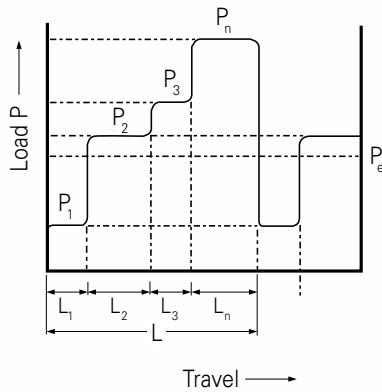

Where:

$P_e$  = mean load (kN)

$P_n$  = load step (kN)

$L$  = total travel (m)

$L_n$  = distance travelled by  $P_n$  (m)

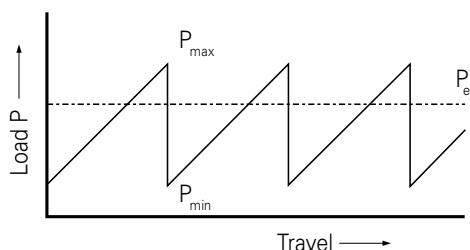

2. For cases where the load vary abruptly:

$$P_e = \frac{2P_{\max} + P_{\min}}{3}$$

Where:

$P_{\min}$  = min. load (kN)

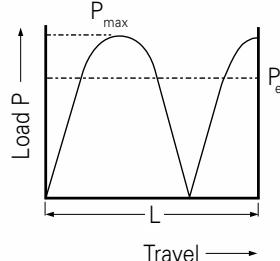

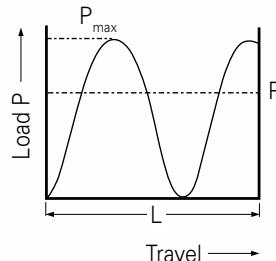

$P_{\max}$  = max. load (kN)

### SINUSOIDAL LOAD CHANGE:

$$P_e \approx 0.65 P_{\max} \text{ (FIG. A)}$$

$$P_e \approx 0.75 P_{\max} \text{ (FIG. B)}$$

### • Frictional resistance

For correct load calculation, frictional resistance of the runner block must be included. Frictional resistance is calculated using the following formula.

$$F = \mu W + f$$

Where:

$F$  = Frictional resistance force (kN)

$W$  = Slide load (kN)

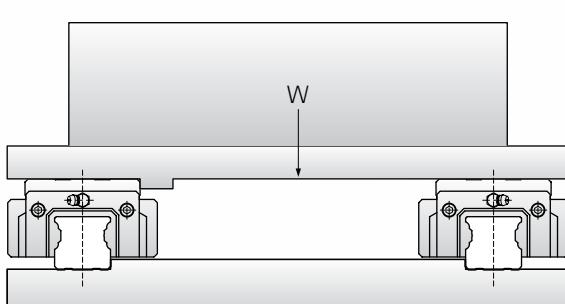

$\mu$  = Coefficient of friction

$f$  = Seal resistance force (kN)

The coefficient of friction for Nook Precision Profile Rails is typically 0.003~0.005 with no preload. Seal resistance force per runner block is typically 0.00196~0.002942 kN.

Example: For a mass load ( $W$ ) of 15.69 kN on 4 runner blocks of NH-TR model, the frictional resistance ( $F$ ) is calculated:

$$\begin{aligned} F &= \mu W + f \\ &= (0.004 \times 15.69) + (0.3 \times 4) = .0745 \text{ kN} \end{aligned}$$

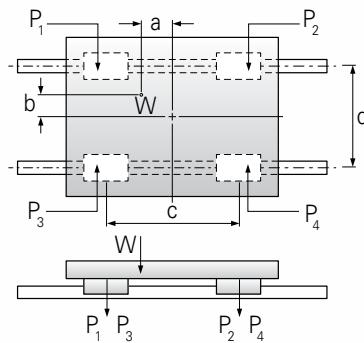

• Load on the runner block

The loads acting on a linear motion system vary according to the location of the center of gravity, the thrust, position, moment, loading speed changes by acceleration and deceleration, cutting forces and other external forces.

It is important that all of these parameters are considered at the design stage.

**HORIZONTAL AXIS**

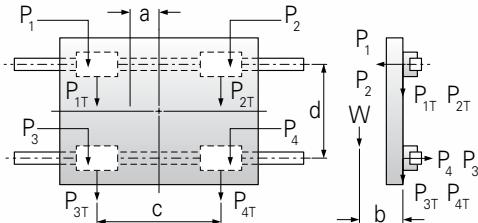

$$P_1 = \frac{1}{4} W + \frac{a}{2c} W + \frac{b}{2d} W$$

$$P_2 = \frac{1}{4} W - \frac{a}{2c} W + \frac{b}{2d} W$$

$$P_3 = \frac{1}{4} W + \frac{a}{2c} W - \frac{b}{2d} W$$

$$P_4 = \frac{1}{4} W - \frac{a}{2c} W - \frac{b}{2d} W$$

**PERPENDICULAR HORIZONTAL AXIS**

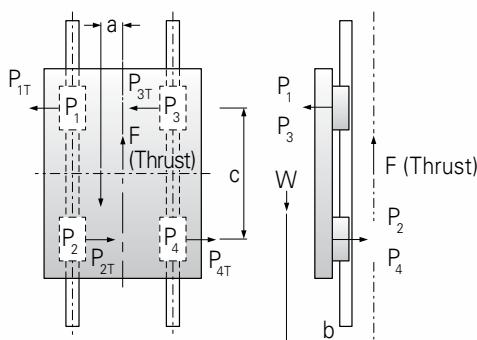

$$P_1 = P_2 = P_3 = P_4 = \frac{b}{2d} W$$

$$P_{1T} = P_{3T} = \frac{1}{4} W + \frac{a}{2c} W$$

$$P_{2T} = P_{4T} = \frac{1}{4} W - \frac{a}{2c} W$$

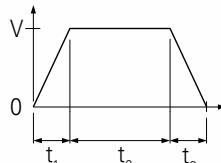

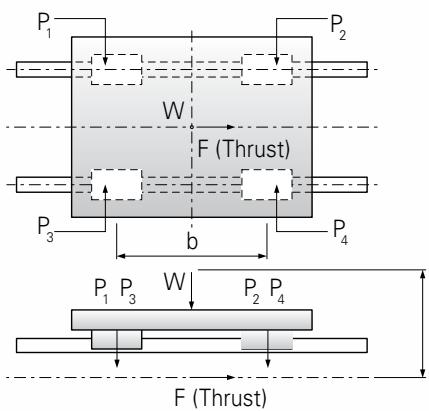

**VERTICAL AXIS**

$$P_{1T} = P_{2T} = P_{3T} = P_{4T} = \frac{b}{2c} W$$

$$P_1 = P_2 = P_3 = P_4 = \frac{a}{2c} W$$

**ACCELERATION DECELERATION**

$$P_1 = P_3 = \frac{1}{4} W + \frac{a}{2b} \frac{v}{gt_1} W$$

$$P_2 = P_4 = \frac{1}{4} W - \frac{a}{2b} \frac{v}{gt_1} W$$

$$P_1 = P_2 = P_3 = P_4 = \frac{1}{4} W$$

$$P_1 = P_3 = \frac{1}{4} W - \frac{a}{2b} \frac{v}{gt_3} W$$

$$P_2 = P_4 = \frac{1}{4} W + \frac{a}{2b} \frac{v}{gt_3} W$$

• While accelerating

• While at a steady-state speed

• While decelerating

g: Gravitational Constant = 9.81 m/s<sup>2</sup>

## CALCULATION EXAMPLE

- **Determination of runner block life**

A sample calculation of runner block life is shown below.

Model NH35TR

Stroke,  $l_s = 1\text{m}$

Load,  $W = 9.8\text{ kN}$

Driving factor,  $f_d = 1.2$

Contact factor,  $f_c = 0.86$

2 rails, 4 runner blocks

No. of cycles,  $n_1 = 5\text{ cpm}$

Driving factor,  $f_d = 1.2$

$$P_1 = \frac{f_d}{f_c} \left( \frac{W}{4} - \frac{100W}{2 \times 800} + \frac{200W}{2 \times 1200} \right) = 2.65\text{kN}$$

$$P_2 = \frac{f_d}{f_c} \left( \frac{W}{4} - \frac{100W}{2 \times 800} + \frac{200W}{2 \times 1200} \right) = 3.88\text{kN}$$

$$P_3 = \frac{f_d}{f_c} \left( \frac{W}{4} - \frac{100W}{2 \times 800} + \frac{200W}{2 \times 1200} \right) = 1.02\text{kN}$$

$$P_4 = \frac{f_d}{f_c} \left( \frac{W}{4} - \frac{100W}{2 \times 800} + \frac{200W}{2 \times 1200} \right) = 2.24\text{kN}$$

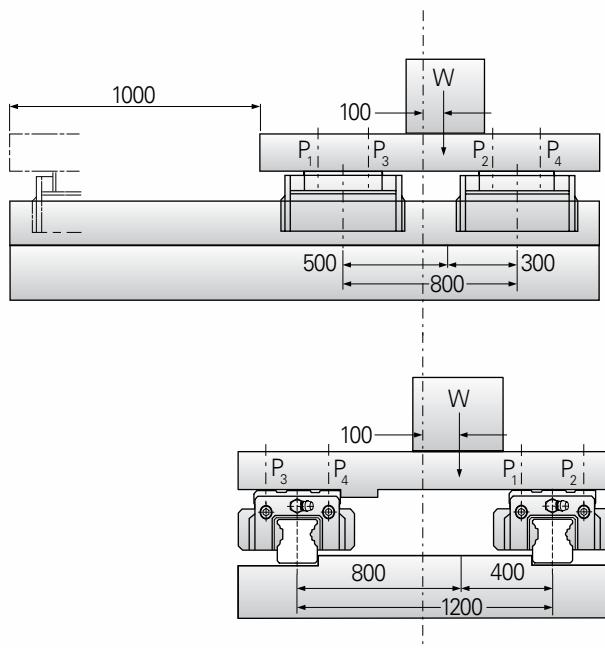

Life of the No.2 runner block which experiences the highest load is determined from  $C=37.55\text{ kN}$  obtained from the dimension table (page 38).

$$L = 50 \times \left( \frac{37.55}{3.88} \right)^3 = 45,321\text{kN}$$

The life in hours can be calculated:

$$L_h = \frac{L \times 10^3}{120 \times l_s \times n_1} = 75,535\text{kN}$$

See unit conversion on page 209.

• Selection of a suitable Profile Rail Assembly as a function of required life

A sample selection is shown below using the following criteria:

Stroke	$l_s = 1\text{m}$
No. of strokes per minute	$n_1 = 5 \text{ cpm} (10\text{m/min})$
Expected life	$L_h = 25000 \text{ hr}$
Load	$W = 19.61 \text{ kN}$
Driving factor	$f_d = 1.5$
Contact factor from (1) (2)	$f_c = 0.86$

$$L = \frac{120 \times l_s \times n_1}{10^3} \times L_h = \frac{120 \times 1 \times 5}{10^3} \times 25,000 = \text{km}$$

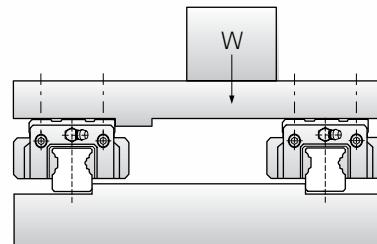

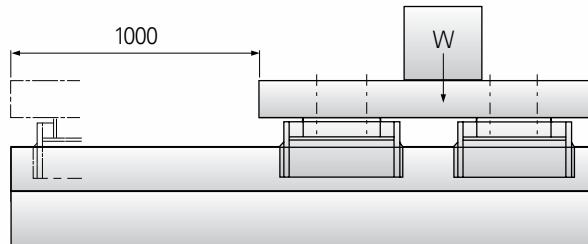

Load per bearing

$$P = \frac{f_d}{f_c} \times \frac{W}{4} = \frac{1.5}{0.86} \times \frac{19.61}{4} = 8.55 \text{ kN}$$

from equation (1)

$$C = P \times \sqrt[3]{\frac{L}{50}} = 8.55 \times \sqrt[3]{\frac{15,000}{50}} = 57.24 \text{ kN}$$

NH45TR ( $C=60.20 \text{ kN}$ ) which has the required dynamic load rating is selected from the dimension table (page 38).

• Determination of runner block life (single axis)

A sample selection is shown below using the following criteria:

Model NH35TR	
Rated dynamic load capacity	$C = 37.55 \text{ kN}$
Rated static load capacity	$C_0 = 62.55 \text{ kN}$
Load	$W = 1.96 \text{ kN}$
External force	$F = .196 \text{ kN}$
Driving factor	$f_d = 1.4$

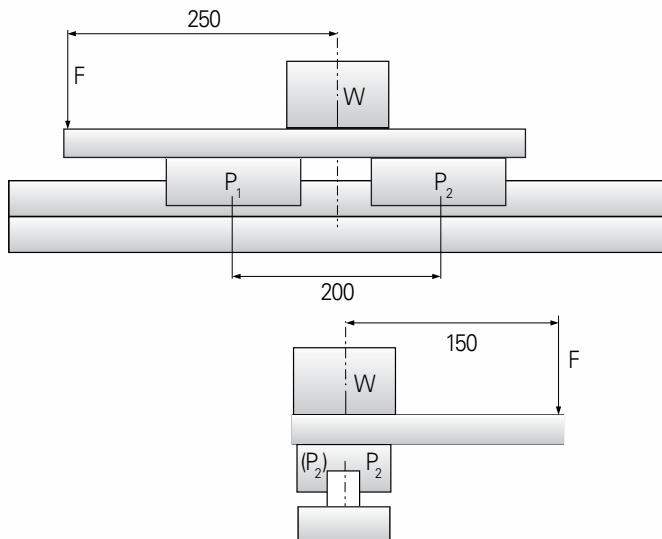

$$P_1 = \frac{W}{1} + \frac{F}{2} + \frac{F \times 250}{200} + \frac{F \times 150 \times C_0}{2 \times M_C \times 10^3} = 3.11 \text{ kN}$$

$$P_2 = \frac{W}{2} + \frac{F}{2} + \frac{F \times 250}{200} + \frac{F \times 150 \times C_0}{2 \times M_C \times 10^3} = 2.13 \text{ kN}$$

Life of runner block ( $L$ ) which is subjected to load  $P_1$  is:

$$L = 50 \times \left( \frac{C}{P_1 \times f_d} \right)^3 = 32,070 \text{ kN}$$

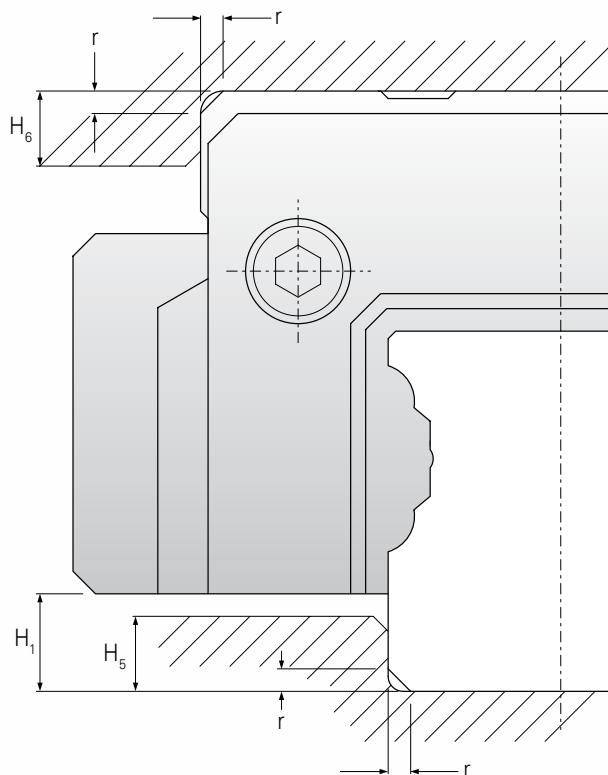

See unit conversion on page 209.

## DESIGN RECOMMENDATIONS & GUIDELINES

### MOUNTING SHOULDER HEIGHT AND CORNER FILLET

In order to provide a register to align the rail or the runner blocks, mounting surfaces should be machined according to the diagram below with shoulder height and corner radii dimensions as shown in the accompanying table.

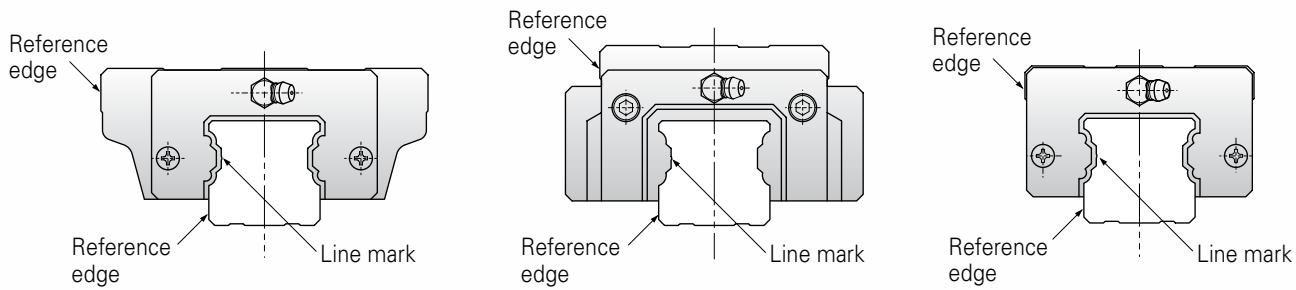

### MOUNTING SHOULDER HEIGHT AND CORNER FILLET

Unit = mm

MODEL NO.	CORNER RADIUS R (MAX)	RAIL TRACK SHOULDER HEIGHT H <sub>5</sub>	SLIDE UNIT SHOULDER HEIGHT H <sub>6</sub>	H <sub>1</sub>
NH-15	0.5	4	4	4.6
NU-15				
NU-20	0.5	3	4	4
NH-20	0.5	4	4	5
NU-25	0.5	3	5	4
NH-25	0.5	5	5	6.5
NH-30	0.5	5	5	7
NU-30				
NH-35	1.0	6	6	8
NU-35				
NH-45	1.0	8	8	11
NU-45				
NH-55	1.0	9	0	12
NU-55				
NH-55	1.0	10	10	14
NU-65				
NH-65	1.0	10	10	14

### INDICATION OF REFERENCE EDGE

Nook Precision Profile Rails have a reference edge on both the rail and the runner block. See below.

See unit conversion on page 209.

## INSTALLATION OF RAIL AND RUNNER BLOCKS

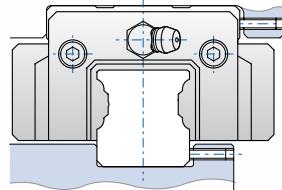

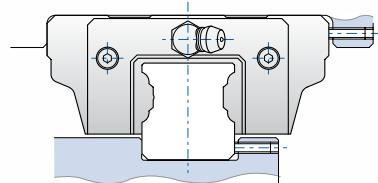

Use any one of the three methods shown below.

The locking set screws should be positioned at the same location as the mounting bolts.

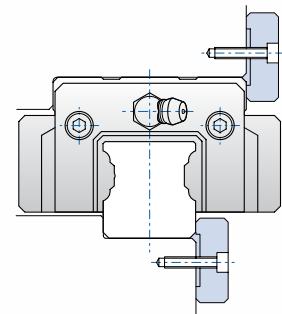

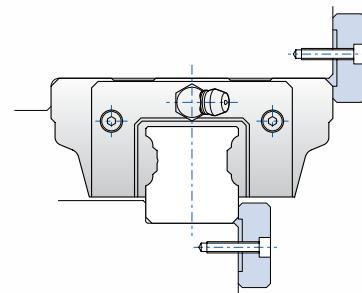

Better alignment is obtained by machining reference edges for both runner block and rail. For optimum performance, the accuracy of the mounting surface should equal that of the rail.

**Note:** Care should be taken when removing the runner block from the rail to avoid balls deflecting the ball retainers and thus falling out.

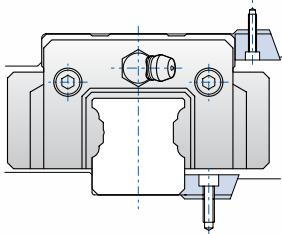

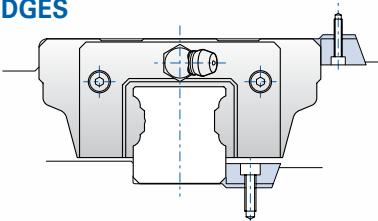

### 1. SET SCREW

### 2. CLAMPS

### 3. TAPERED WEDGES

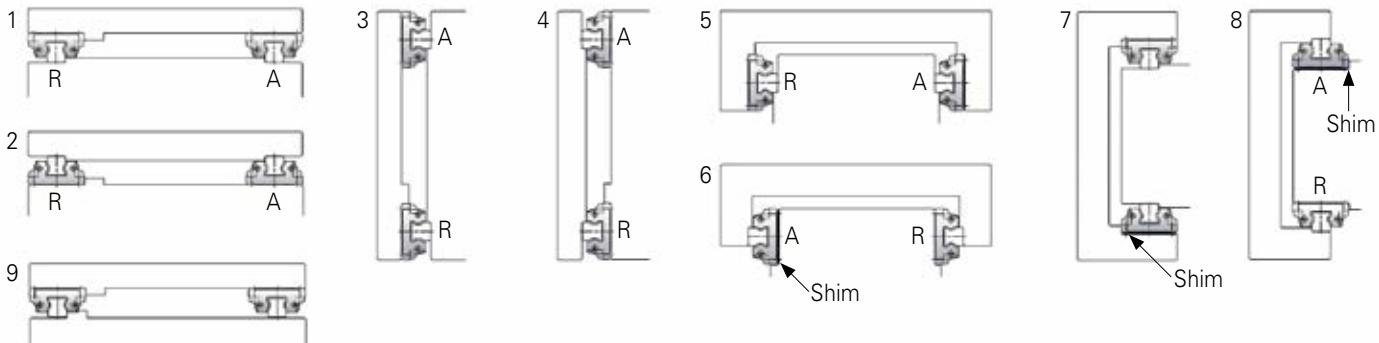

## SYSTEM DESIGN CONFIGURATIONS FOR NOOK PRECISION PROFILE RAILS

Shown below are various installations for profile rail systems. One through four are the most common. Five through eight are for limited height applications. Number nine is the least accurate.

	Opposing			
	Horizontal	Vertical	Horizontal	Vertical
Rail Track Fixed	1,9	3	5	7
Runner Block Fixed	2	4	6	8

See examples below: A= Adjustable Side • R= Reference Side

## BELLOW COVERS

When additional protection is required, the use of Nook bellows is recommended. The chart below indicates the bellows dimensions. PVC coated nylon material is used exclusively. Neoprene-cloth and chemically resistant materials are also available upon request.

BELLOW MODEL NO.	PROFILE RAIL MODEL NO.	W	H	h	ABOVE OR BELOW BLOCK	L FACTOR
JS15	NH-15 EA	48	24.5	5	Above 6mm	1.28
JS15	NH-15 ER	41	23.5	5	Above 6mm	1.28
JS20	NH-20 EA	51	28	5	Above 3mm	1.28
JS20	NU-20 ER	46	26.4	4	Above 4mm	1.28
JS25	NH-25 EA	51	28	7	Even	1.28
JS25	NU-25 ER	47	28.5	4	Above 1mm	1.28
JS30	NH-30 EA	58	35	7	Even	1.20
JS30	NU-30 ER	60	35	7	Even	1.20
JS35	NH-35 EA	72	40	8	Even	1.17
JS35	NU-35 ER	70	40	8	Even	1.17
JS45	NH-45 EA	83	45	11	Even	1.17
JS45	NU-45 ER	81	47	11	Even	1.17
JS55	NH-55 EA	100	55	14	Even	1.13
JS55	NU-55 ER	100	55	12	Even	1.13
JS65	NH-65 EA	117	68	14	Even	1.11

See unit conversion on page 209.

### EXTENDED LENGTH CALCULATIONS

Maximum extended length:

$$\text{Extended}_{\max} = \text{Stroke} \times L \text{ Factor}$$

Minimum collapsed length:

$$\text{Collapsed}_{\min} = \text{Extended}_{\max} - \text{Stroke} + 10\text{mm}$$

Add 10mm to bellow compressed length for hardware.

## LUBRICATION & SEALING

Proper lubrication and contamination protection are an essential requirement for Nook Precision Profile Rails.

### SEAL

A standard feature of Nook runner blocks is a special composite rubber or felt seal that effectively retains grease (lithium soap base) within the runner block.

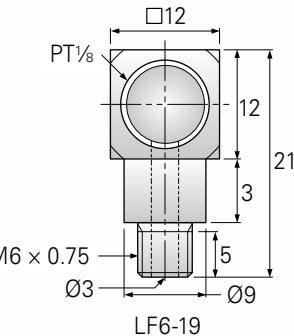

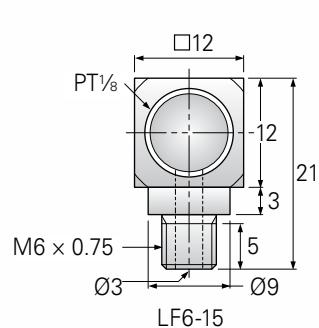

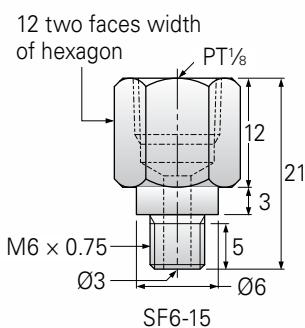

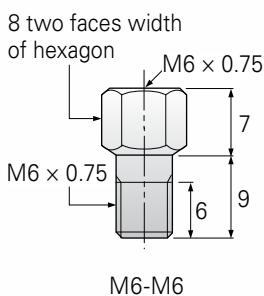

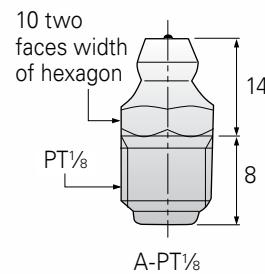

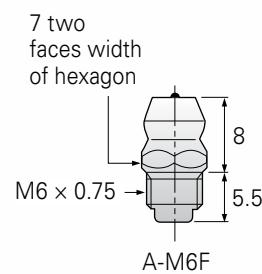

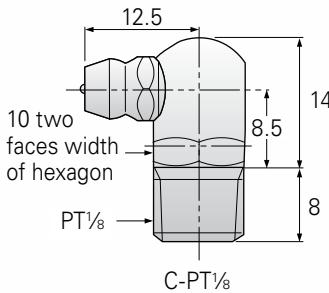

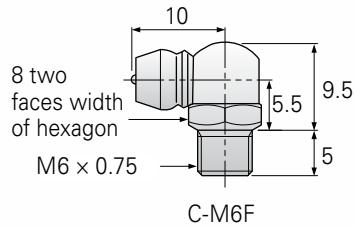

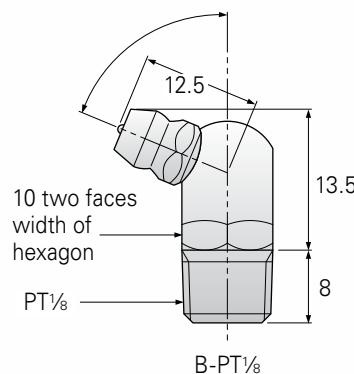

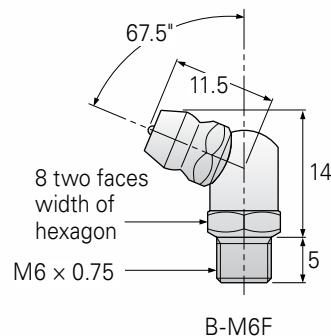

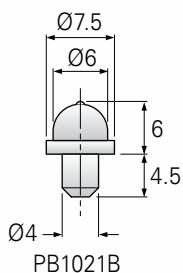

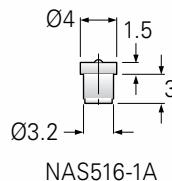

### SCRAPERS

Stainless scraper plate option for enhanced protection of the seal as well as removal of containment build up such as light weld spatter and overspray.

### MOUNTING HOLE CAPS

For sealing quality and protection use the cap plugs supplied by Nook to cover the mounting holes in the rail flush with the top surface.

## OVERVIEW & FEATURES

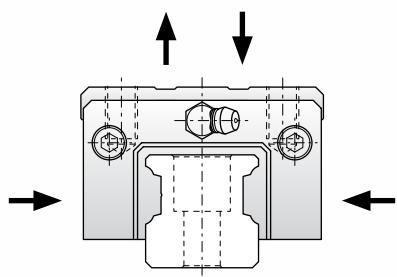

### NOOK PROFILE RAIL DESIGN

Nook Ultra Heavy Load Type Runner Blocks maintain circulation of the balls by a retainer and end cap. The four rows of balls on the inner runner block are arranged in two rows on either side facing each other and contacting at a 45° angle. As the load is transmitted the balls contact the rail at two points at an inclusive angle of 90°. In turn, the contact with the outer track is the same, making a square load force configuration.

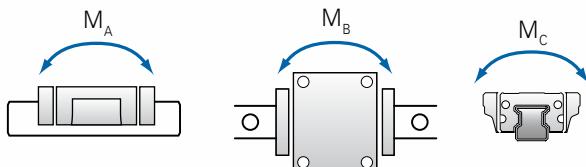

### EQUAL LOAD IN FOUR DIRECTIONS

The shape of Nook runner blocks have an equal rated load capacity in any direction. Equal rigidity is therefore obtained in any of the four loading directions making Nook runner blocks ideal for single or combination loads.

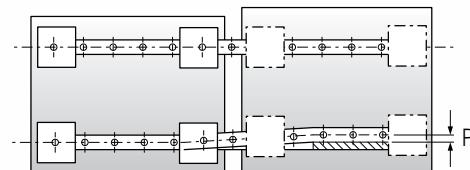

### MOUNTING ERROR ABSORPTION AND ROLLING MOMENT RIGIDITY

Nook runner blocks are designed to absorb some of the mounting inaccuracies without any significant increase in the sliding friction.

### ERROR ALLOWANCE IN THE PARALLELISM BETWEEN TWO RAILS - HORIZONTAL PLANE

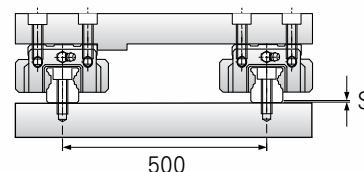

Permissible Tolerance (P) for Parallelism

### CLEARANCE

MODEL NH	P	T0	T1	T2-T3
<b>15</b>	—	18	25	
<b>20</b>	18	20	25

## OVERVIEW & FEATURES

### NOOK PROFILE RAIL DESIGN

Nook Heavy Load and High Speed Type Runner Blocks recirculate the balls via a tube. The four rows of balls on the inner runner block are arranged 2 rows each on either side facing each other and contacting at a 45° angle. As the load is transmitted the balls contact the track at two points at an inclusive angle of 90°. In turn, the contact with the outer track is the same making a square load force configuration.

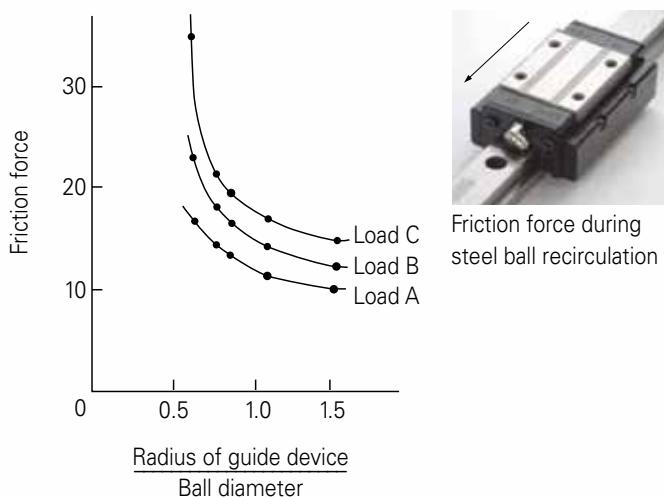

### EQUAL LOAD IN FOUR DIRECTIONS

The shape of Nook runner blocks has an equal rated load capacity in any direction. Equal rigidity is therefore obtained in any of the four loading directions making Nook runner blocks ideal for single or combination loads.

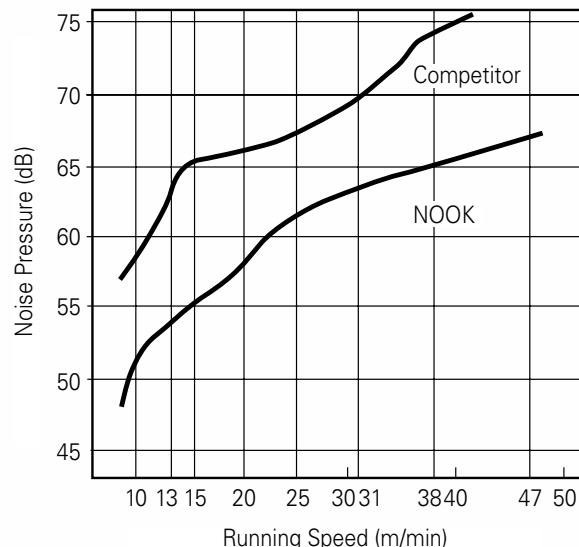

### RATIO BALL RECIRCULATION METHOD

Experiments have shown that a ratio of the ball diameter to the return curvature radius of 1.5:1 results in reduced friction with lower noise signature and lower vibration and less variation in friction at high speeds when compared to normal return ratios of 0.6:1 to 1.1:1 as found in standard systems. Nook high-speed runner blocks utilize this ratio.

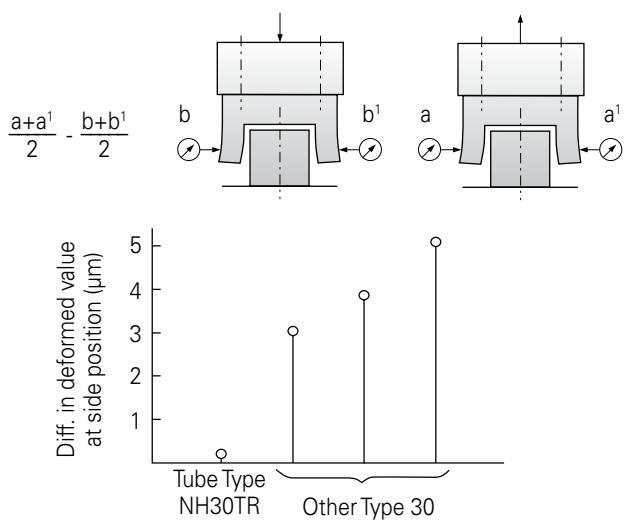

### LOW NOISE

As a result of the reduction in friction, the noise vibration signature decreases during travel and consequently reduces the audible noise.

### RIGIDITY OF RUNNER BLOCK

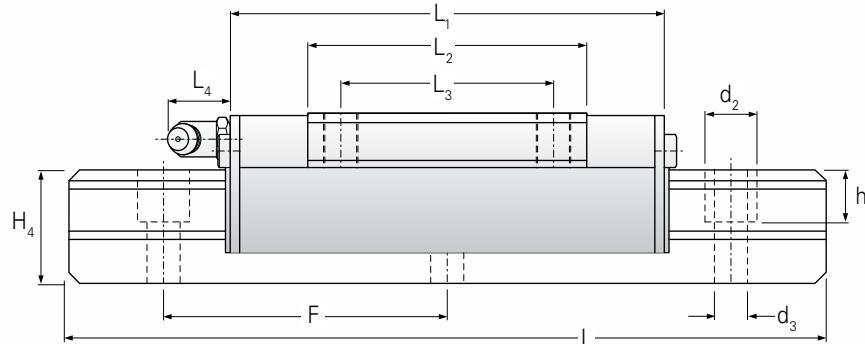

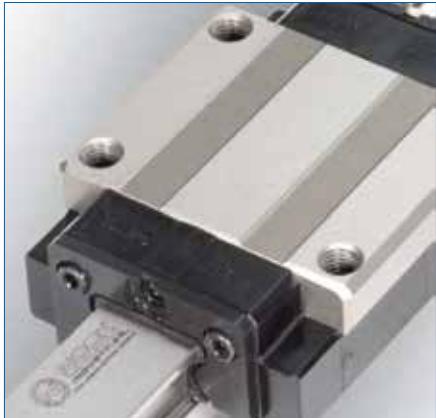

The "Tube" Type Nook runner block has a solid structure with no return holes for balls as with the conventional runner block. The tube type design offers a stronger construction, giving the advantage of near equal resistance to deformation in both the radial and reverse radial loaded directions at the sides of the runner block.

### CONSISTENT TRAVELLING ACCURACY

High Speed Type runner blocks have a simple machined form offering continuity of movement at elevated speeds.

## OVERVIEW & FEATURES

### NOOK PROFILE RAIL DESIGN

Nook Ultra Heavy Load Type Runner Blocks maintain circulation of the balls by a retainer and end cap. The four rows of balls on the inner runner block are arranged in two rows on either side facing each other and contacting at a 45° angle. As the load is transmitted, the balls contact the rail at two points at an inclusive angle of 90°. In turn, the contact with the outer track is the same, making a square load force configuration.

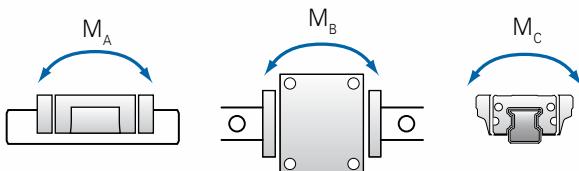

### EQUAL LOAD IN FOUR DIRECTIONS

The shape of Nook runner blocks have an equal rated load capacity in any direction. Equal rigidity is therefore obtained in any of the four loading directions making Nook runner blocks ideal for single or combination loads.

### MOUNTING ERROR ABSORPTION AND ROLLING MOMENT RIGIDITY

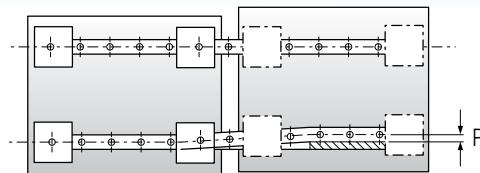

Nook runner blocks are designed to absorb some of the mounting inaccuracies without any significant increase in the sliding friction.

### EXCELLENT VIBRATION BEHAVIOR

Nook Heavy Load and Compact Type Runner Blocks have improved dynamic stiffness at high oscillation rates. The four-way load construction offers high rigidity and high dynamic stiffness to eliminate resonance with motor, etc.

Port Option .....	67

## PRODUCT OVERVIEW NARC / NHRC

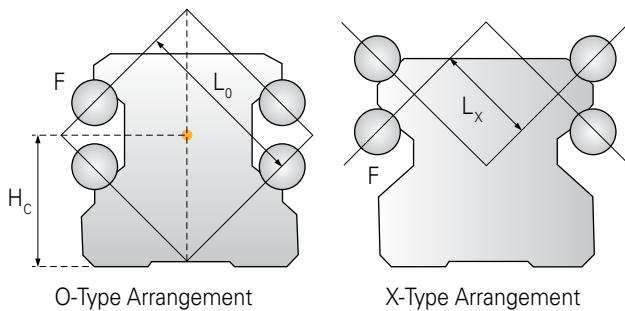

Nook's NARC / NHRC Linear Guide Series uses the O-type arrangement for the four row ball circulation design. The contact angle between the rail and ball is 45 degrees, and can realize the 4 directional load effects. NARC / NHRC linear guide blocks have a longer length to allow for a greater  $M_r$  value to increase

Unit = mm

MODE CODE	$L_0$	$H_c$

$$F = M_c/L_0 \quad (L_x)$$

NARC / NHRC

Other Brands

the rigidity and static moment capability. In addition, runner blocks feature a larger ball bearing, which allow them to outperform competitor's models by 10% to 30% regarding load capabilities. The products have characteristics of high load, high moment, and high stiffness.

Inner storage lubrication storage pad (bottom)

Stainless steel reinforcement plate

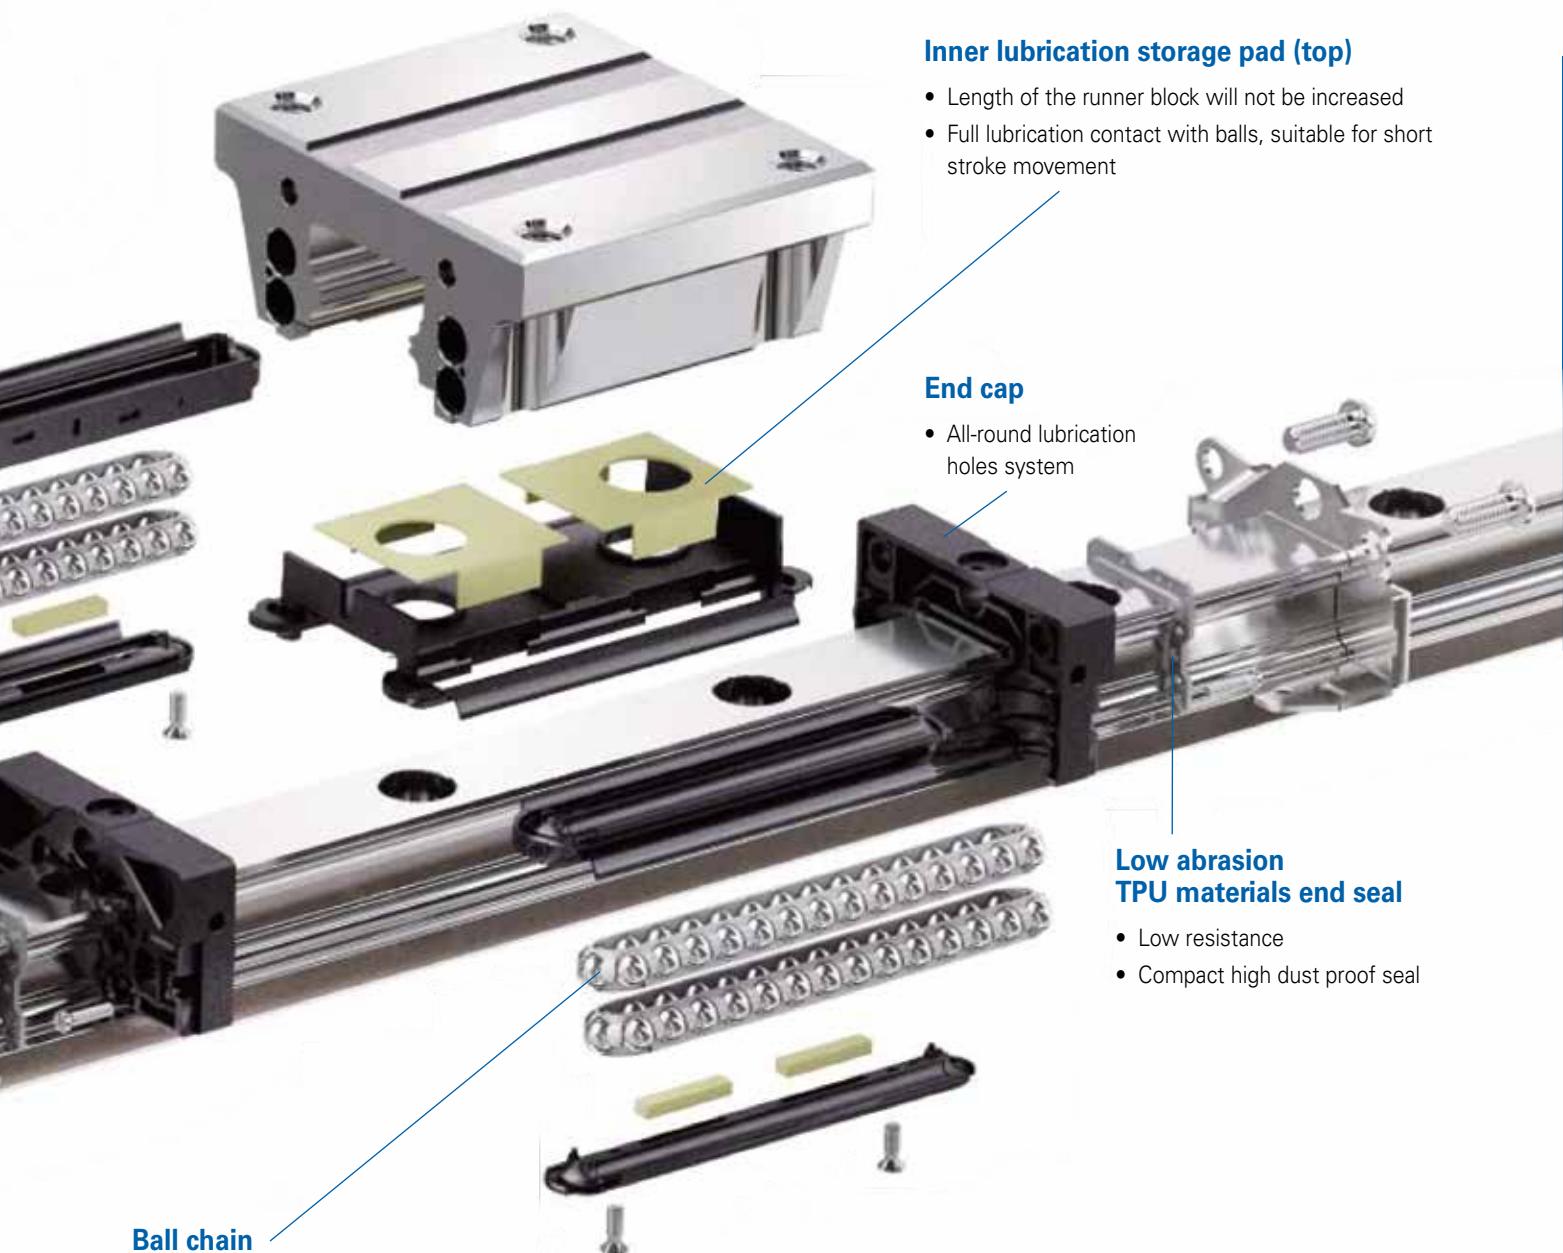

- Total scraping of objects above 0.3mm
- Increase x-axis direction force capacity

# LINEAR GUIDANCE

## CAGED BALL PROFILE RAIL

CAGED BALL PROFILE RAIL

### Ball chain

- Quiet, prolonged service life
- High dynamic load and high load capabilities
- Excellent dynamic performance: Vmax > 10 m/s

### Inner lubrication storage pad (top)

- Length of the runner block will not be increased
- Full lubrication contact with balls, suitable for short stroke movement

### End cap

- All-round lubrication holes system

### Low abrasion TPU materials end seal

- Low resistance
- Compact high dust proof seal

## PRODUCT DESIGN NARC / NHRC

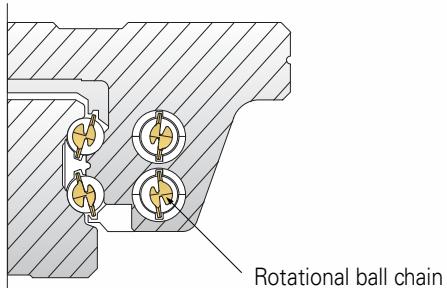

### CAGED BALL CHAIN DESIGN

The Caged Ball Chain Design provides lower friction and lower noise than traditional profile rail block designs. The benefit of a caged ball design prevents the bearings from incidental contact, which reduces friction, wear and noise.

Rotational Ball Chain:

- Reduces noise
- Higher speed in motion
- Prolong service life
- Prolong re-lubrication period

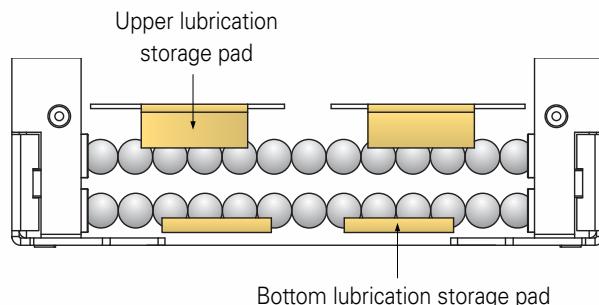

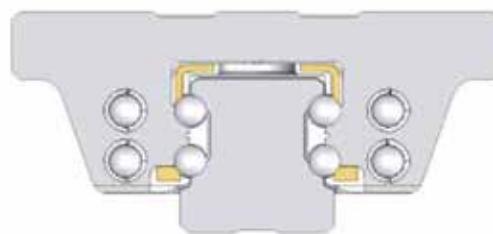

A uniquely patented ball chain design provides a flexible link between the block and bearings. This gives the ball chain enough space to rotate and move in the circulation channel and overcome the friction of the curvature. In addition, the space between upper and bottom parts have oil storage functions, increasing the re-lubrication interval and service life.

### LUBRICATION DESIGN

#### Inner oil storage and oil supply system design

Inner Lubrication Storage Pad design does not increase length of runner block and contacts directly with ball bearings. Lubrication oil can be injected through lubrication holes. The Lubrication Storage Pad can save enough lubrication oil to ensure long term lubrication effects, conforming to environment protection needs and lowering maintenance costs. Excellent performance when used in short stroke.

#### Multi-position lubrication port

The lubrication fittings can be moved from the top, bottom or side of the runner block. An o-ring seal is used for easy/clean lubrication.

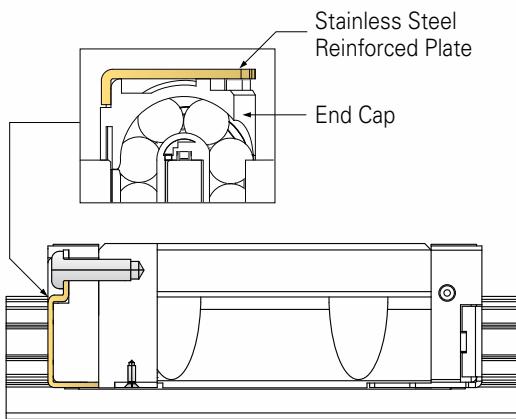

## REINFORCEMENT PLATE PATENT DESIGN

Using two stainless steel reinforcement plates on each end increases the rigidity of the end caps.

The clearance between the rail profile with the seal design is below 0.3mm, reinforcing the steel plates while having scraper functions.

The NARC / NHRC type uses the stainless steel reinforcement plates to strengthen the bottom retainer, while increasing X-axis direction force capacity, and increasing operation speed.

Velocity<sub>max</sub> = 10 m/s   Acceleration<sub>max</sub> = 500 m/s<sup>2</sup>

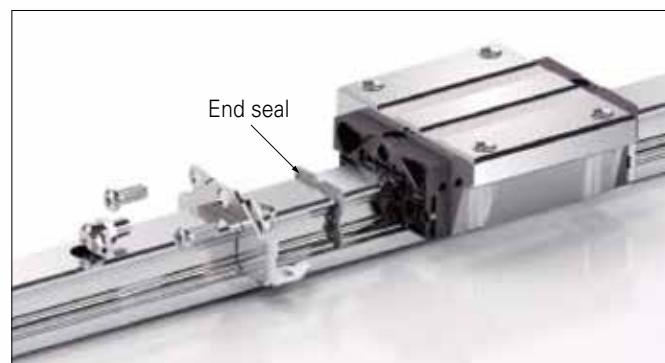

## End seals

The Nook double lip type end seals can prevent foreign objects from entering from the side and prevent lubrication oil and grease from leaking. The flexibility of the TPU material has better friction resistance ability and better prevents cracking characteristics than typical NBR plastic.

**Standard seals (B):** Suitable for most conditions, with slight contact with the rail, having both scraping function with low friction.

**Reinforcement seals (S):** Seal comes in direct contact with the rail surface, thus having better dustproof and lubrication retention. Nook recommends using this type of seal in environments that are exposed to long periods of high dust. The friction will be higher than standard seals.

## DUSTPROOF DESIGN

### Stainless steel reinforcement plate

With clearance between rail profile of no more than 0.3mm, the plate can scrape large items such as iron fillings to protect the end seals.

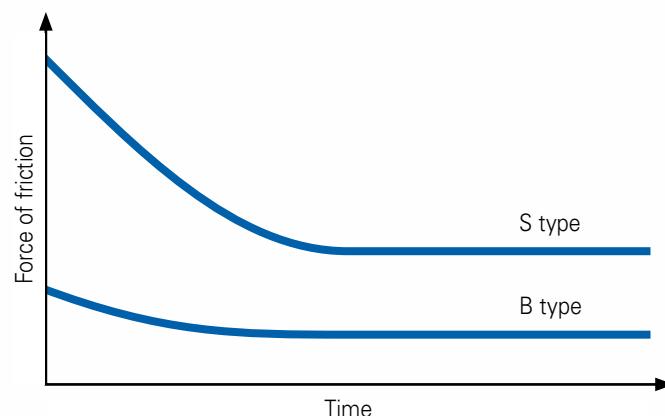

### Inner seals

The newly designed inner seals, slant inward at a 45 degree angle. This protects against foreign objects from sliding into the rails while maintaining low friction. It also allows the lubrication oil to be maintained inside the runner block and prolong the re-lubrication interval.

### Bottom seals

The bottom seals can prevent foreign objects from entering the bottom and prevent lubrication from leaking out. The full sealing design reduces the amount of oil usage, prolongs the re-lubrication interval and the service life.

**Comparison of friction of seals** The friction will be highest on new linear rails. After a short period of operation, friction will reduce to a constant level.

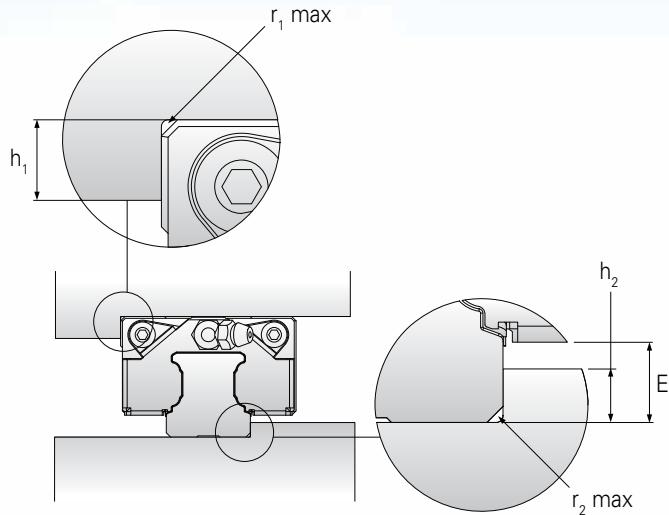

## INSTALLATION NOTICE NARC / NHRC

### DIMENSION OF REFERENCE EDGE

To ensure the linear guide is precisely assembled with your machined table, Nook machines a recess in the reference edge corner. The corner of the machine table must be smaller than the chamfer of the linear guide to avoid interference.

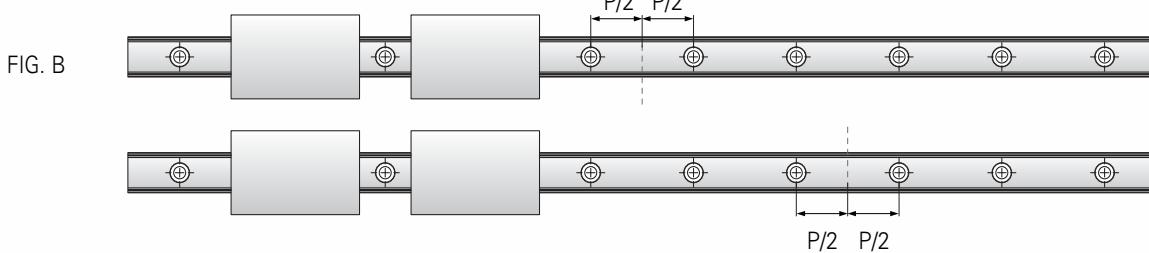

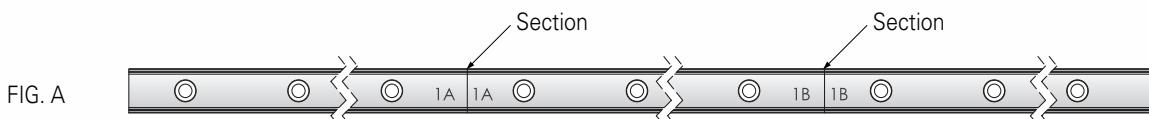

TYPE	r <sub>1</sub> max	r <sub>2</sub> max	h <sub>1</sub>	h <sub>2</sub>	E
15	.5	.5	4	2.5	3.3
20	.5	.5	5	4	5
25	1	1	5	5	6
30	1	1	6	5.5	6.6
35	1	1	6	6.5	7.6
45	1	1	8	8	9.3
55	1.5	1.5	10	10	12

### RAIL JOINT

The standard length of rail is 4 meters, Nook provides jointed rail solutions. The joint number will be laser marked on the rail.

1. Follow the joint number to assemble. (Shown in FIG. A)
2. When having two or more rails running in parallel that have butt-joints, Nook suggests setting the joints in different positions between master and slave rail to avoid the change in accuracy. (Shown in FIG. B)
3. Follow the recommended tightening torques to fasten the screws from inside out.

## TECHNICAL INFORMATION NARC / NHRC

### PRELOAD AND CLEARANCE

The NARC / NHRC linear guides provide the following 4 different preload classes: VC, V0, V1 and V2.

### Application

VC = Smooth motion, low friction

V0 = For precision situations, smooth motion

V1 = High stiffness, precision, high load situations

V2 = Super high stiffness, precision, super high load situations

NARC ( $\mu\text{m}$ )								
Class	Description	Preload Value	Clearance					
			15	20	25	30	35	45
VC*	Micro gap	0	+10~+2	+10~+2	+11~+3	+12~+4	+12~+4	+13~+5
V0	Light preload	.02C	+2~4	+2~5	+3~6	+4~7	+4~8	+5~10
V1	Medium preload	.05C	-4~10	-5~12	-6~15	-7~18	-8~20	-10~24
V2	Heavy preload	.08C	-10~16	-12~18	-15~23	-18~27	-20~31	-24~36
								-28~45

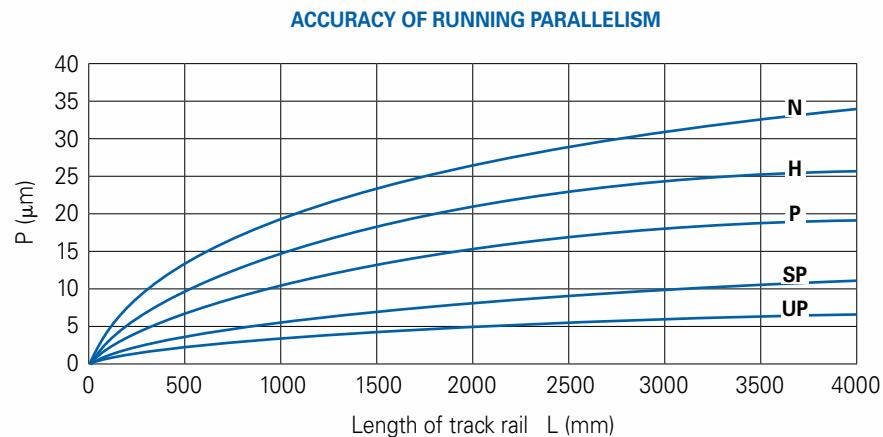

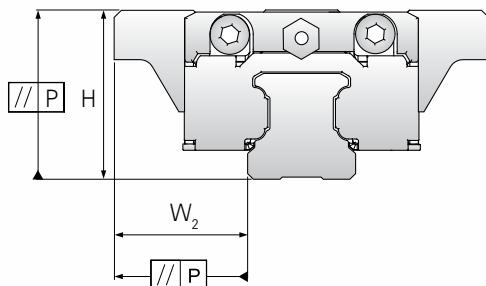

NHRC ( $\mu\text{m}$ )								
Class	Description	Preload Value	Clearance					
			15	20	25	30	35	45
VC*	Micro gap	0	+10~+2	+10~+2	+11~+3	+12~+4	+12~+4	+13~+5

## TECHNICAL INFORMATION NARC / NHRC

### ACCURACY

The NARC / NHRC linear guides provide 5 different classes of precision: N, H, P, SP, and UP class. Engineers can choose a different class depending on machine applications.

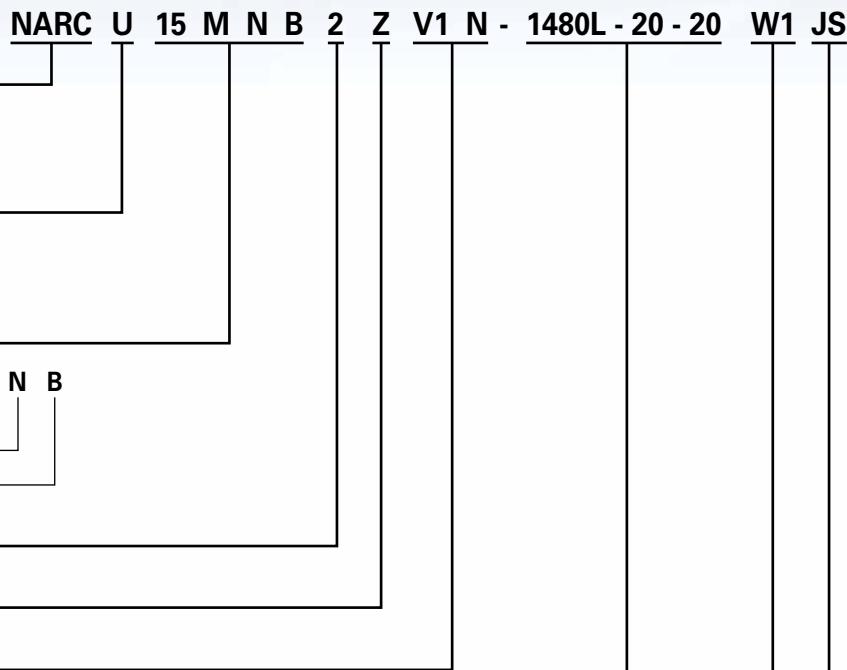

ACCURACY CLASSES					
Accuracy Classes (μm)	Normal (N)*	High (H)	Precision (P)	Super Precision (SP)	Ultra Precision (UP)
Tolerance of dimension height	H ±100	±40	±20	±10	±5
Variation of height for different runner block on the same position of track rail	ΔH 30	15	7	5	3
Tolerance of dimension width	W2 ±40	±20	±10	±7	±5
Variation of width for different runner block on the same position of track rail	ΔW2 30	15	7	5	3

APPLICATION					
Class	Movement, Motion	Manufacturing Equipment	High Precision Manufacturing Equipment	Test Equipment	
N*	●	●			
H	●	●	●		
P		●	●	●	
SP			●	●	
UP				●	
Examples	Mechanical Movers Industrial Robots Office Machinery	Woodworking Machine Punching Press Injection Molding Machine	Lathe/Milling/ Grinding Machine Electrical Discharge Machining (EDM) CNC Machining Center	Three Dimensional Measuring Instrument Detection Mirror/ Head Shaft XY Platform

The above rating load capacities and static moment are calculated according to ISO 14728 standard. The rating life for basic dynamic load rating is defined as the total 100km travel distance that 90% of a group of identical linear guides can be operated individually under the same conditions free from any material damage caused by rolling fatigue. When the standard of 50km travel distance is applied, the above basic dynamic load rating C of ISO 14728 should be multiplied by 1.26 for conversion.

The above rating load capacities and static moment are calculated according to ISO 14728 standard. The rating life for basic dynamic load rating is defined as the total 100km travel distance that 90% of a group of identical linear guides can be operated individually under the same conditions free from any material damage caused by rolling fatigue. When the standard of 50km travel distance is applied, the above basic dynamic load rating C of ISO 14728 should be multiplied by 1.26 for conversion.

## PRODUCT INTRODUCTION

### Precision

NMR Miniature linear guide series have three accuracy grades for design selection:  
Precision (P), High (H), Normal (N).

### Material

Regardless of series, NMR miniature linear guides use stainless steel processed material.

### Embedded inverse return design

**Designed for high load, high movement application**

**Unique ball re-circulation design**

**Steel reinforcement plate ensures sturdy assembly and longer life**

### **Lubrication storage design**

Environmentally-friendly system requires less lubricant.

### **Material**

Regardless of series, MR miniature linear guides use stainless steel processed material.

## PRODUCT INTRODUCTION NEW DESIGN

### EMBEDDED INVERSE HOOK DESIGN FOR REINFORCED MECHANICAL INTEGRATION

When the runner block is in motion and changing direction, the circulating stainless steel balls inside the raceway generate impact force against the plastic end cap. As the demand for rapid motion in the automation industry has increased, Nook has invented a new design to improve high speed running capability. Plastic inverse hooks for miniature linear blocks tightly secure block components to handle the impact force effectively by distributing the applied stress over a large area.

### UNIQUE BALL RE-CIRCULATION DESIGN

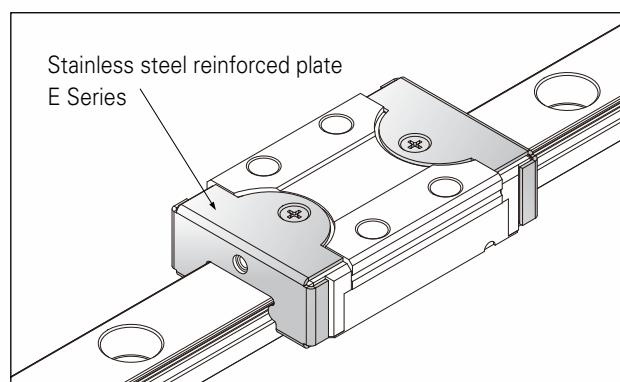

The stainless steel ball re-circulation hole and channel constructs are fully sealed by plastic frame and end caps. The simple structure substantially reduces contact surface between steel ball and metal, thus reduces noise significantly. The lubrication oil storage embedded in the circulation channel significantly extends the re-lubricating interval, extends life and reduces preventative maintenance.

Suitable for:

- High speed belt driven mechanism
- High speed carrier design
- Automation linkage between stations.

### NMR-EE SERIES STAINLESS STEEL REINFORCED PLATES ENSURE HIGH ROBUSTNESS

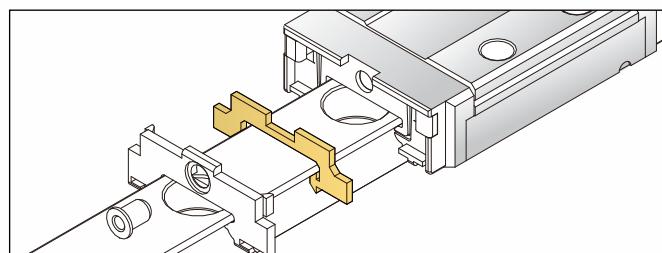

Runner blocks are equipped with two stainless steel plates which reinforce the end-cap from end to end. This sturdier design supports higher running speeds. The plates can also function as scrapers to facilitate smooth travel.

### LUBRICATION STORAGE DESIGN

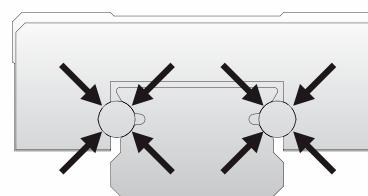

Lubricant injection holes are featured at both ends of the runner block. As the balls circulate during movement of the block, the stainless steel balls carry lubrication oil to the raceway, thus efficiently lubricating the balls and the oil raceway, and achieving long-term, maintenance-free linear motion. This design also provides superb lubricating ability for short stroke movement. A newly-invented embedded lubrication pad design provides a selection of options for machine design.

(3M / W, 5M / W, 7M / W, 9M / W, 12M / W, 15M / W)

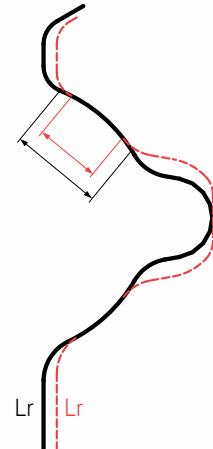

### HIGH LOAD AND HIGH MOMENT CAPACITY

The NMR Miniature Linear Guide series is designed using two rows of recirculating balls. The design uses a Gothic profile with a 45° contact angle to achieve equal load capacity in all directions. Within the restriction of limited space, larger stainless steel balls are used to enhance the load and torsion resistance capacity.

Nook linear guides (indicated with the thick black line to the right) provide greater surface contact as compared to competing products (indicated with the thin red-dotted line at right) when comparing same widths rails.

### DUST PROOF DESIGN

Our standard design comes equipped with an end seal that effectively restricts dust contamination and prolongs lubrication, ensuring longer product life. Specially-designed low friction seal lips do not affect running smoothness.

## TECHNICAL INFORMATION

### ACCURACY

NMR Miniature Linear Guide series have three accuracy classes: P, H, and N.

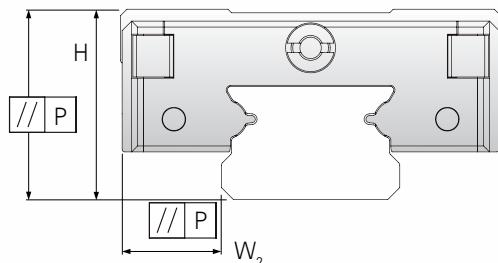

TABLE OF ACCURACY

Accuracy classes ( $\mu\text{m}$ )	Precision P	High H	Normal N*
Tolerance of dimension height H	H ±10	±20	±40
Variation of height for different runner block on the same position of rail	$\Delta H$ 7	15	25
Tolerance of dimension width W	$W_2$ ±15	±25	±40
Variation of width for different runner block on same position of rail	$\Delta W_2$ 10	20	30

\* Stocked

### SPEED

The maximum speed for the standard NMR-SS/ZZ type is:

$$\text{Velocity}_{\max} = 3 \text{ m/s}$$

Maximum acceleration:

$$\text{Acceleration}_{\max} = 250 \text{ m/s}^2$$

(if the preload V0, capable of reaching 40 m/s<sup>2</sup>)

The maximum speed for the standard NMR-EE/EZ type is:

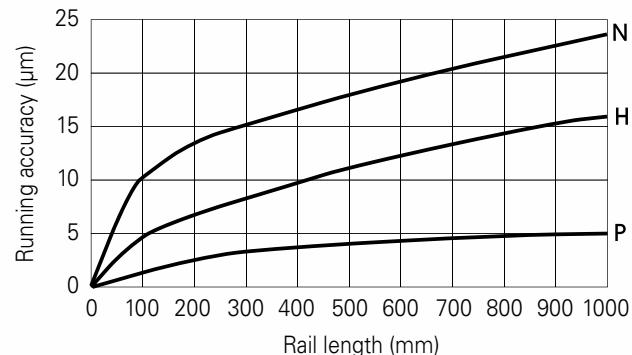

$$\text{Velocity}_{\max} = 5 \text{ m/s}$$

Maximum acceleration:

$$\text{Acceleration}_{\max} = 300 \text{ m/s}^2$$

(if the preload V0, capable of reaching 60 m/s<sup>2</sup>)

Accuracy of the running parallelism

### PRELOAD CLASSES

The NMR Miniature Linear Guide series have three degrees of preload: V0, Vs and V1 (as described in the Table of Preload below). Preload can enhance stiffness, precision, and torsion resistance, but will negatively affect life and friction.

TABLE OF PRELOAD

Preload type	Model code	Clearance ( $\mu\text{m}$ )						Application
		3 - 0	3 - 0	4 - 0	4 - 0	5 - 0	6 - 0	
Clearance*	V0	3 - 0	3 - 0	4 - 0	4 - 0	5 - 0	6 - 0	Very smooth
Standard	Vs	1 - 0	1 - 0	2 - 0	2 - 0	2 - 0	3 - 0	Smooth and precision
Light preload	V1	0 - -0.5	0 - -1	0 - -3	0 - -4	0 - -5	0 - -6	High rigidity Minimize vibration High precision Load balance

\* Stocked

## TECHNICAL INFORMATION

### LIFE

#### Static Load Rating C

For the static load traveling along the acting direction, the maximum calculated stress at the rolling elements and the raceway, by a curvature radius  $\leq 0.52$ , is 4200MPa and, by a curvature radius  $\geq 0.6$ , is 4600MPa.

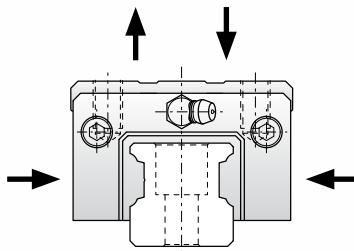

To convert 100kl of life to 50kl of live, use the following formula:

$$C_{50} = 1.26 \times C_{100}$$

**Note:** Under such stress, a permanent total deformation is generated at this contact point corresponding to about 0.0001 times the rolling element diameter (ISO 14728-2).

#### Static Moment Ratings M

For C, Co, M of each model refer to dimensional table. Nook Precision Profile Rails have the same dynamic load capacity in four directions: radial, reverse-radial and bi-lateral.

#### Static Safety Factor

Generally, the maximum permitted static load on the runner block is equivalent to static load ratings  $C_0$ . However, in repeated linear motion applications, unexpected load is caused by the inertia when the system starts or stops. Therefore, the safety factor  $f_s$  should be calculated in order to determine the allowable load.

Where:

$$\frac{C_0}{P_0} \geq f_s$$

$C_0$  = static load ratings  
 $P_0$  = equivalent load (static load, impact load)  
 $f_s$  = static safety factor

The value of  $f_s$  for general use is indicated in the table below:

OPERATING CONDITION	Minimum $f_s$
Normal operation	1~3
Smooth running required	3~4
Operation with impact or vibration	4~5

#### Dynamic Load Rating C

When the dynamic loads are applied to normal load zones with constant magnitude and direction, theoretically, the rate life of a linear guide can reach 100 km of travel distance (ISO 14728-1).

#### Rating Life L

The dynamic rating is based on 100km of life. When the standard of 50km travel distance is used, the dynamic load rating will exceed the value based on the standard ISO 14728-1 by 20% or more.

Where:

$$L = 100 \times \left(\frac{C}{P}\right)^3$$

$L$  = expected life  
 $C$  = basic load ratings  
 $P$  = equivalent load

Where the stroke (m) and the number of cycles per minute  $n_1$  (cpm) are constant, the rated fatigue life  $L_h$  (hr) is calculated by the following formula.

Where:

$$L_h = \frac{100 \times 10^3}{120 \times l_s \times n_1} \times \left(\frac{C}{P}\right)^3$$

$L_h$  = expected Life (hr)  
 $l_s$  = stroke length (m)  
 $n_1$  = number of strokes per minute

#### EQUIVALENT DYNAMIC LOAD AND SPEED

If the load and speed are not constant, each actual load and speed must be taken into account and both will influence the life.

#### Equivalent Dynamic Load

If there is a change in load only, the equivalent dynamic load can be calculated according to the following formula:

$$P = \sqrt[3]{\frac{q_1 \times F_1^3 + q_2 \times F_2^3 + \dots + q_n \times F_n^3}{100}}$$

Where:

$P$  = Equivalent dynamic load (N)  
 $q_n$  = Percentage of stroke (%)  
 $F_n$  = Discrete load steps (N)

#### Combined Dynamic Load

If the linear guide takes on load from an arbitrary angle, its equivalent dynamic load rating is calculated using the following formula:

$$P = F_x + F_y$$

Where:

$P$  = Equivalent dynamic load (N)  
 $F_y$  = External dynamic load, vertical N  
 $F_x$  = External dynamic load, horizontal N

### Equivalent Speed

If there is a change in speed only, the equivalent speed can be calculated using the following formula:

$$v = \frac{q_1 \times v_1 + q_2 \times v_2 + \dots + q_n \times v_n}{100}$$

Where:

P = Equivalent dynamic load (N)

q<sub>n</sub> = Percentage of stroke (%)

v = Average speed (m/min)

v<sub>n</sub> = Discrete speed steps (m/min)

If there are changes in both load and speed, the equivalent dynamic load can be calculated using the following formula:

$$P = \sqrt[3]{\frac{q_1 \times v_1 \times F_1^3 + q_2 \times v_2 \times F_2^3 + \dots + q_n \times v_n \times F_n^3}{100}}$$

### Combining Linear Forces with Moment Loads

If both load and moment act on the linear guide, the equivalent dynamic load can be calculated by the formula.

$$P = F + M \times \frac{C_0}{M_0}$$

Where:

P = Equivalent dynamic load (N)

F<sub>n</sub> = External dynamic load N

M = Static moment Nm

M<sub>0</sub> = Static moment rating Nm

According to ISO 14728-1, the equivalent load(P) shall not exceed ½C.

### FRICITION

The NMR miniature linear guide series is characterized with light starting friction and low, stable and consistent friction during operation.

$$F_m = \mu \times F$$

Where:

F = Load (N)

F<sub>m</sub> = Friction (N)

NMR Miniature linear Guide series friction factor is approximately

$\mu=0.002-0.003$ .

### Source of friction

- Resistance of the sealing system
- Resistance of the collision between the balls during operation
- Resistance from the collision between the balls and the return path
- Rolling resistance of the balls in the gothic arch load zone
- Resistance from the churning of the lubricant in the runner block
- Resistance from the penetrated contaminant

### FRICITION WITH END SEAL UNDER LUBRICATION

NMR size	Friction with End Seal (N <sub>max</sub> ) (under lubrication)	
	M	W
2	0.08	0.2
3	0.08	0.2
5	0.08	0.2
7	0.1	0.4
9	0.1	0.8
12	0.4	1.0
15	1.0	1.0

### SEALING DESIGN

The NMR miniature linear guide series adopts end seals on both ends of the runner block. Optional side seals build an all-around closed sealing system.

### OPERATING TEMPERATURE

The NMR miniature linear guide can operate in a range of temperatures from -40°C - 80°C. For short term operation it can reach up to 100°C.

## TECHNICAL INFORMATION

### LUBRICATION

The loaded rolling elements and the raceway will be separated at the contact zone by a thin layer of oil.

The effective lubrication will:

- Reduce friction                              • Prevent corrosion
- Reduce wear                                  • Dissipate heat and increase service life

#### Oil Lubrication

Nook recommends LBL1 (see page 198). A lubricant formulated for rolling friction should be used with Nook Linear Bearings. In applications where operating speeds are low and loads are light, Nook linear bearings can be used without lubrication at a reduced life. However, to protect the highly polished bearing surfaces from corrosion and wear, a lubricant is recommended.

### LUBRICATION INTERVAL

Speed, load, stroke length, and operating environment affect re-lubrication interval. A safe lubrication interval can only be obtained by practical observation.

Lubrication interval shall not exceed one year. Lubrication can be applied through the injection hole on both ends of the block by using a special injector available from Nook.

- Lubrication shall be applied before lubricant is contaminated or changes color
- Amount of lubricant is 1/2 of the first lubrication. If lubricant oil is applied, add until oil over flows (see Table 1 below)
- Lubrication shall be applied under operation temperature. Move block back and forth while adding lubricant to ensure even distribution. **Water based lubricant oil should not be applied to the block or rail**
- If the stroke is smaller than one time or greater than 10 times the block steel body length, the re-lubrication interval shall be shortened

TABLE 1

Model code	First lube (cm <sup>3</sup> )	Model Code	First lube(cm <sup>3</sup> )
3MN	0.02	2WL/3WN	0.03
3ML	0.03	3WL	0.04
5MN	0.03	5WN	0.04
5ML	0.04	5WL	0.05
7MN	0.12	7WN	0.19
7ML	0.16	7WL	0.23
9MN	0.23	9WN	0.30
9ML	0.30	9WL	0.38
12MN	0.41	12WN	0.52
12ML	0.51	12WL	0.66
15MN	0.78	15WN	0.87
15ML	1.05	15WL	1.11

### Caution

- For the ZZ and EZ series:
  1. Block contains lubricant which can be directly installed on the machine with no need to be washed.
  2. If washing the blocks, please do not soak the block in the lubricant before both the detergent of lubrication storage area and Cleaning Naphtha are totally dry. The block is ready for installation only on the condition that the lubrication storage area is full of the lubricant.
- The linear guide must be lubricated for protection before the first use. Contamination of any kind should be avoided
- The runner block should be moved back and forth during lubrication
- Generally, the lubricant can be added onto rail raceway
- The lubricant can be injected into the lubrication holes on either end of the runner block
- A thin coating of lubricant should be maintained on the surface of the rail raceway at all times
- Re-lubricate before contamination or discoloration of the lubricant occurs
- Notify Nook Engineering when used in acidic, alkaline or clean room applications
- Contact Nook Engineering for lubrication assistance if the runner block is used in a wall mount configuration

### LUBRICATION APPLICATOR

When reordering lubrication applicator, please specify appropriate part number and needle:

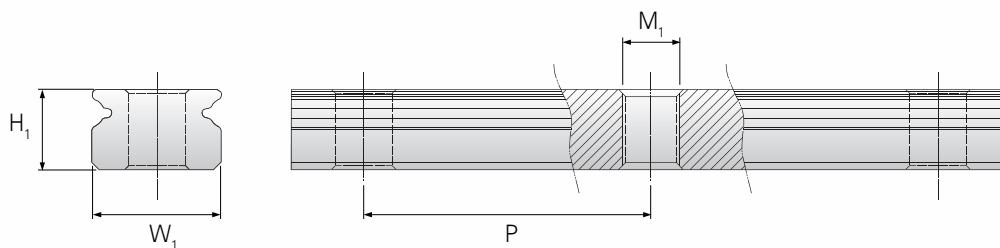

MODEL CODE	NEEDLE
5M/5W	21G
7M	20G
7W	19G
9M/9W	18G
12M/12W	18G
15M/15W	15G

**Note:** Applicator does not come prefilled. Capacity = 10ml. LBL1 is the recommended lubricant. Other lubricants are available.

### Grease Lubrication

When lubricant grease is required, synthetic oil-based lithium soap grease with a viscosity between ISO VG32-100 is recommended.

### UPWARD MOUNTING STANDARD NMRU-M SERIES

### THE MOUNTING SURFACE

Surface roughness – the mounting surface should be ground or fine milled to reach a surface roughness Ra1.6.

### SCREW TIGHTENING TORQUE (Nm)

Screw Grade 12.9	Steel	Cast Iron	Non Iron Metal
M2	0.6	0.4	0.3
M3	1.8	1.3	1
M4	4	2.5	2

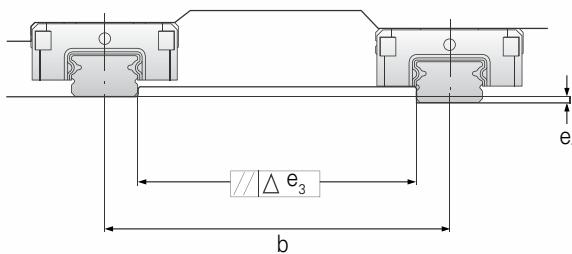

## GEOMETRIC AND POSITIONAL ACCURACY OF THE MOUNTING SURFACE

Inaccurate mounting surfaces will affect the operational accuracy of the linear guide. The rating lifetime will also be shortened. Insure the mounting surface height differential is greater than the values calculated by the formulas below.

$$e_1 \text{ (mm)} = b(\text{mm}) \times f_1 \times 10^{-4}$$

$$e_2 \text{ (mm)} = d(\text{mm}) \times f_2 \times 10^{-5}$$

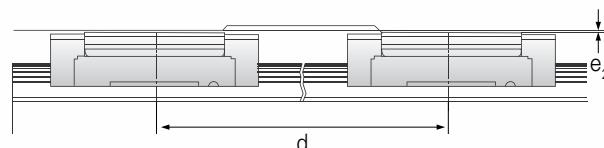

$$e_3 \text{ (mm)} = f_3 \times 10^{-3}$$

## REFERENCE SURFACE

Rail: Both sides of the track rail can be the reference surface without any special marking.

Block: Reference edge is opposite to the groove marking side.

### LENGTH OF RAIL

Butt-jointing is required when lengths exceed L<sub>max</sub>. (For detailed information, please contact Nook technical support)

### CUSTOMIZATION CODE

#### J = Butt-jointing Track Rail

When the required length of the customer's rail exceeds the standard rail length, a butt-joint can be specified. The rail butt-joint indication is marked as illustrated above.

#### B = Special Process for Block

For special process requirements, please contact Nook Engineering.

#### C3 or C4 = Plugs For Mounting Holes on Rail

C3 applies to NMR9M, NMR12M, NMR15M, NMR7W & NMR9W rails. C4 applies to NMR12W, NMR15W rails. All rails are shipped with plugs for mounting holes unless otherwise specified.

#### R = Special Process for Rail

For special process requirements, please contact Nook Engineering

#### S = Special Straightness for Rail

The straightness of the linear guide rail is specially calibrated by precision fine grinding.

#### G = Customer Designate Lubricant

According to application environment.

#### GN = No Lubricant

#### GC = Low Dust Generation

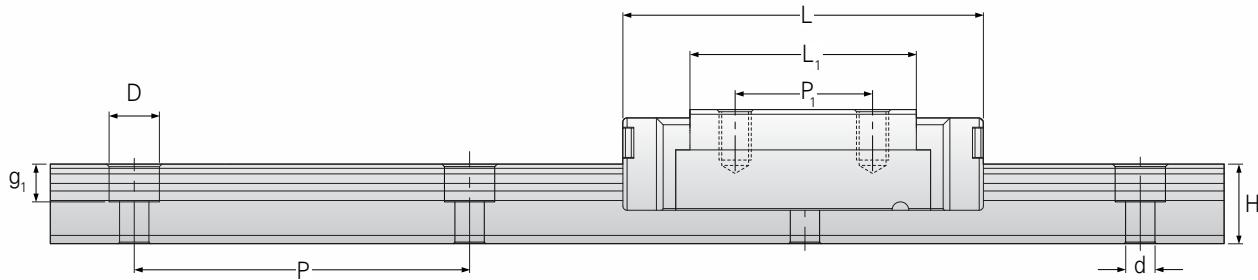

Suitable for clean room environments.

#### I = Inspection Report

Please contact Nook Engineering.

GRV-S*	S : SU440C + Mi	SUS304	100Cr6	X
GBV	SUJ2 (52100)	Phosphor Bronze (C5191)	X	SUJ2

\* GRV-S series is suitable for application in clean rooms.

### CROSS ROLLER / CROSS BALL RAIL

Composed of two pieces of stainless steel rails with V-shaped grooves which been hardened and ground forming precise rolling elements. Cross roller rail moves with alternate 90 degrees rollers to accomplish high parallelism and high flatness. In construction, rolling elements are transmitted in cross-contact by precise roller and V-shaped grooves in rails, and in non-circulation.

### APPLICATIONS

Widely used across a variety of applications where heavy duty or light duty is required. They are used in a variety of manufactured products such as:

- Measuring Instruments
- Printed Circuit Boards
- Drilling Machine
- Slide Table Used In Optical Measuring Instrument
- Precise Gauge In Optical Experiment
- Precision Fine Tuning Optical Stage
- Operation Mechanism
- Survey Device
- Precise Positioning Quantitative Movement X-Ray Device
- Micro-Hole Edm

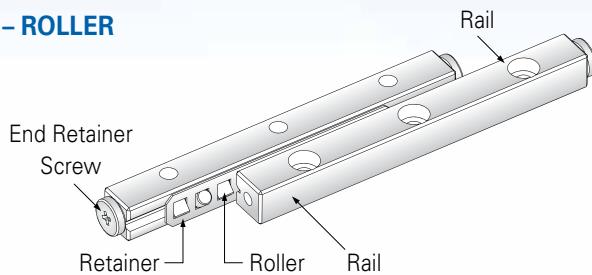

### LUBRICATION

All linear motion applications require proper lubrication. Abrasion and lack of lubrication will reduce life by 90%.

Function of lubrication:

1. Reduce friction between running parts.
2. Apply a light oil film on rolling surface to reduce abrasion of metal to extend life of rolling elements.
3. Coating on metal surface to prevent rust.

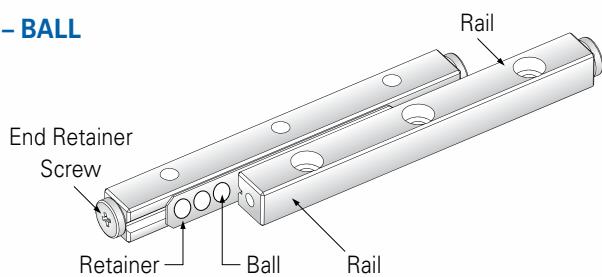

### GRV – ROLLER

Composed of precise crossed rollers with hardened stainless steel forming V-shaped rail guides to create linear motion elements with high accuracy.

Limited stroke linear motion system with high rigidity, high load, and fast moment.

### GBV – BALL

Composed of ball retainer combined with precision ball bearings matched with precision ground V-shaped grooved rails. Limited stroke linear motion system with low friction, light load and high accuracy.

### ADVANTAGES

Suited for micro-movement applications due to small amount of frictional resistance, with almost no difference between starting friction resistance and dynamic friction resistance.

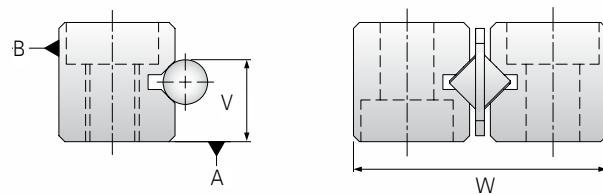

**Stability in low speed applications:** Even in the case of light loading, low to high speed variations are stable due to the low amount of frictional resistance.

**High rigidity - high loading capacity applications:** Compared between roller or ball rails. Roller rails have a higher capacity due to their larger contact area, less elasticity deformation, and non-circulation, and great effective number of units in contact.

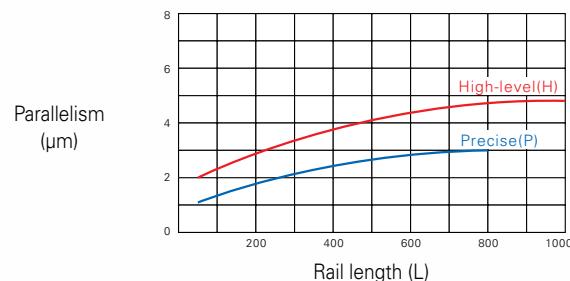

**Low noise:** Nook linear motion cross roller rail has no circulated rotating, no noise occurred. Using roller with roller retainer makes no noise caused by contact friction in between each rolling unit moves alternately, to ensure a quiet movement motion.

### ACCURACY LEVEL

ITEM	HIGH LEVEL	PRECISE LEVEL
	H	P
Parallelism of rolling plane to A & B	As shown in drawing below	
Allowable dimension tolerance to height V	0.02	0.01
Paired mutual tolerance to height V	0.01	0.005
Allowable dimension tolerance to width W	0	0
	-0.20	-0.10

Rail length and parallelism of rolling plane

### ACCURACY ALLOWABLE TOLERANCE

	LENGTH (mm)		STRAIGHTNESS ( $\mu\text{m}$ )
	Above	Below	
<b>High Level (H)</b>	—	50	2.0
	50	100	2.0
	100	160	3.0
	160	310	3.0
	310	510	4.0
	510	600	4.0
<b>Precise Level (P)</b>	—	50	1.0
	50	100	1.0
	100	160	2.0
	160	310	2.0
	310	510	3.0
	510	600	3.0

## LOAD

### LOAD DEFINITIONS

The load ratings are based on each roller/ball bearing element. When calculating actual rating, the number of rolling elements must be determined.

**Roller/Ball Bearing Capacity** The max usable load per rolling element.

**Basic Dynamic Load** Used when calculating life for each rolling element. Based on 50Km of travel.

**Basic Static Load Rating** Maximum impact load prior to causing permanent deformation for each rolling element.

### STROKE AND ROLLER / BALL QUANTITY CALCULATIONS

When selecting Cross Roller or Ball Rails, several considerations must be made:

- Stroke Length
- Quantity of rolling elements (Roller or Ball)
- Accuracy
- Load capacity

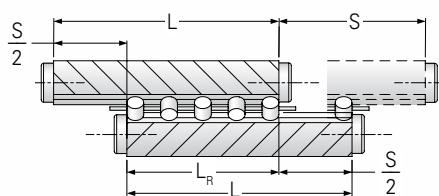

#### Calculation of retainer length and roller quantity

The number of rolling elements is dependent on the retainer length. To calculate the number of rolling elements you must first calculate the retainer length. Retainer Length is the length of engagement between both side of the rail when fully extended.

#### Calculating the retainer length

$$L_R = L - \frac{S}{2}$$

Where:  
 $L_R$  = Retainer length, mm  
 $L$  = Rail length, mm  
 $S$  = Stroke length, mm

#### Calculating the number of rolling elements

$$R_n = \frac{L_R}{P_2} + 1$$

Where:  
 $R_n$  = Number of rolling elements (integer)  
 $L_R$  = Retainer length, mm  
 $P_2$  = Catalog pitch length

### CROSS ROLLER / BALL RAIL ASSEMBLY LOAD CALCULATIONS

#### Calculating Cross Roller / Ball Rail assembly load rating

$$F = R_n \times F_E$$

Where:

$F$  = Rail capacity

$R_n$  = Roller quantity

$F_E$  = Roller/Ball capacity (N) for each rolling element

#### Selecting the correct travel length

When selecting the appropriate rail assembly, the expected travel should be 80% of catalog Max Travel.

$$\text{Effective travel} = S \times .8$$

Where:

$S$  = Catalog Stroke Length, mm

### LIFE CALCULATION

Basic dynamic load rating is based on 50km of travel. Use the formulas below to calculate equivalent life in given applications.

$$\text{Ball } L = (F_d \times F_v \times \frac{\sum c}{P})^{10/3} \times 50 \quad \text{Roller } L = (F_d \times F_v \times \frac{\sum c}{P})^3 \times 50$$

Where:

$L$  = Usage life (km)

$P$  = Loading

$F_d$  = Safety factor in loading direction

$F_v$  = Safety factor in variable loading

### APPLICATION EXAMPLE

When using cross roller side by side, which specification should be chosen?

Specification.....GRV04

Loading.....P = 4000N

Stroke length.....SW = 120mm

#### Calculating the Retainer Length

$$L_R = 200\text{mm} - (120\text{mm}/2) \quad \text{Where:}$$

$L_R = 140\text{mm}$

#### Calculating the number of rolling elements

$$R_n = 140\text{mm}/7 + 1 \quad \text{Where:}$$

$R_n$  (integer) = 21

#### Calculating Assembly Load rating

$$F = 21 \times 390\text{N} \quad \text{Where:}$$

$F = 8190\text{N}$

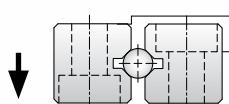

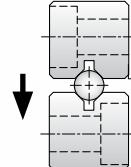

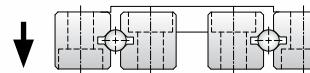

Load ratio = 4000/8190 × 100 = 48.84%

#### Calculating Travel length

$$\text{Maximum stroke } 154\text{mm} \times .8 = 123.3\text{mm}$$

## LOAD CAPACITY & LOADING DIRECTION SAFETY FACTOR

### LOAD CAPACITY OF CROSS BALL RAIL

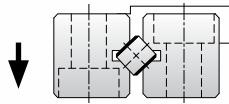

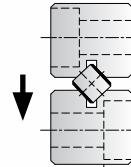

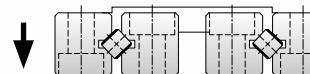

CONDITION	SINGLE - AXIS USE	SINGLE - AXIS VERTICAL USE	DUAL - AXIS ABREAST USE
Loading direction			
Basic dynamic load rating $\Sigma C$	$B^{3/4} \times \cos \frac{\pi}{4} \times C$	$B^{3/4} \times 2^{7/9} \times \cos \frac{\pi}{4} \times C$	
Basic static load rating $\Sigma C_0$	$B \times \cos \frac{\pi}{4} \times C_0$	$B \times 2^{7/9} \times C_0$	

C = basic dynamic load rating (N)

 $C_0$  = basic static load rating (N)

B = ball quantity in single row

### LOAD CAPACITY OF CROSS ROLLER RAIL

CONDITION	SINGLE - AXIS USE	SINGLE - AXIS VERTICAL USE	DUAL - AXIS ABREAST USE
Loading direction			
Basic dynamic load rating $\Sigma C$	$C = (\frac{R}{2})^{3/4} \times C$	$C = (\frac{R}{2})^{3/4} \times C \times 2^{7/9}$	
Basic static load rating $\Sigma C_0$	$C_0 = \frac{R}{2} \times C_0$	$C_0 = R \times C_0$	

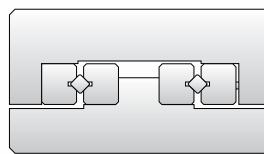

C = basic dynamic load rating (N)

 $C_0$  = basic static load rating (N)

B = ball quantity in single row

R/2 = Integer, no remainder

### SAFETY FACTOR $F_d$ IN LOADING DIRECTIONS

Center vertical loading  Vertical loading

Side loading

CLASSIFICATION	LOADING DIRECTION	$F_d$
Basic dynamic loading	Vertical	1.0
	Side	0.9
	Counter vertical	0.8
Basic static loading	Vertical	1.0
	Side	0.9
	Counter vertical	0.8

### COMMON CONTACT FACTOR $F_c$ IN SINGLE RAIL

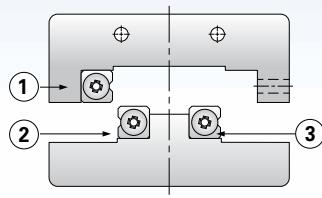

Quantity of Linear systems assembled in a single shaft	Contact factor $F_c$
1	1.00
2	0.81
3	0.72
4	0.66
5	0.61

### SAFETY FACTOR $F_v$ IN VARIABLE LOADING

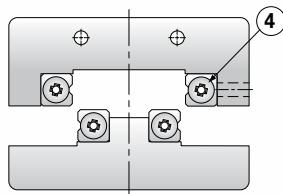

Running condition	$F_v$
Normal running	1 ~ 0.5
Smooth motion required	0.5 ~ 0.25
Vibration - shock	0.3 ~ 0.2

## ASSEMBLY INSTRUCTIONS

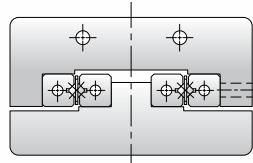

1. Apply oil in low viscosity on contact planes, fix rail 1 - 3 with regular torque.

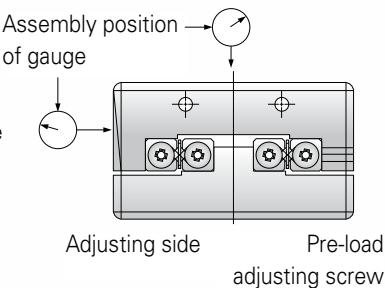

2. Temporarily lock rail in adjusted side 4.

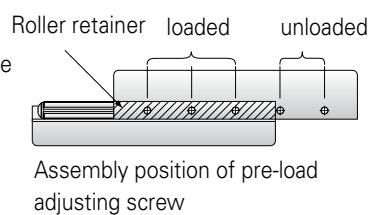

3. Disassemble end screw from end of one side, and carefully insert roller retainer to nearby center of the rail.  
 • Lock the end screw.  
 • Slowly move table back and forth to the rail end and adjust roller retainer position to rail center.

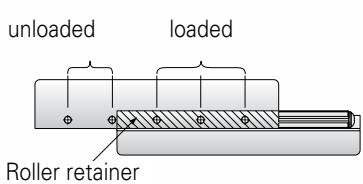

4. Fix gauges both in center and side of the table (level plane).

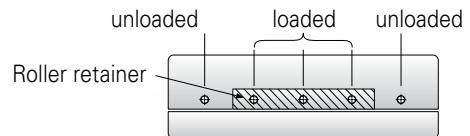

5. Move table to end of one side, and lock pre-load adjusting screw slightly.

6. Move table to the end of the other side, as above description, and lock pre-load adjusting screw slightly.

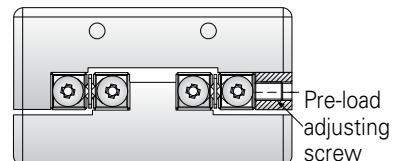

7. Return table to center and lock pre-loads adjusting screw slightly, ensuring that all clearance has been removed.

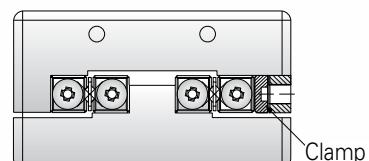

8. Finally securely lock the rail 4. As steps of screw adjustment, move table back and forth, then have the table over roller retainer, and lock screws in order.

### APPLICATION EXAMPLES

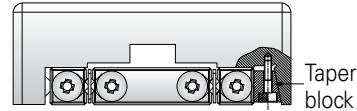

Pre-load adjusting screw-set screw is used to do normal adjustment.

Use clamp to achieve requirement of accuracy and rigidity.

Use taper block to meet special requirement of high rigidity and high accuracy.

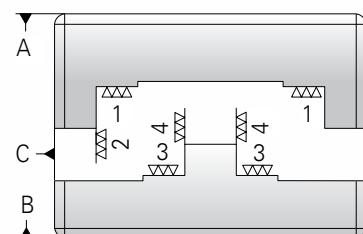

### INSTALLATION NOTES

In order for Nook linear motion cross roller rails to function, it is recommended to install assembly planes with accuracy same as parallelism precisely processed in linear motion cross roller rail.

All burrs, dent, dust, miscellaneous objects on the rail of table and base need to be cleaned spotlessly and keep eyes on assembly operation application.

Preload adjustment, too much preload would cause press damage to reduce life; it's normally recommended to use zero or tiny preload.

Accuracy of installation assembly plane

Unit = mm

**OPERATION FEATURES**

**Misalignment**

Operating Cross Roller/Ball Rails and Assemblies with improper alignment of assembly will reduce life and accuracy.

**Retainer Deviation**

Nook linear motion cross roller rail, in high speed, off-center load, or vibration load may cause retainer deviation.

**End Stops**

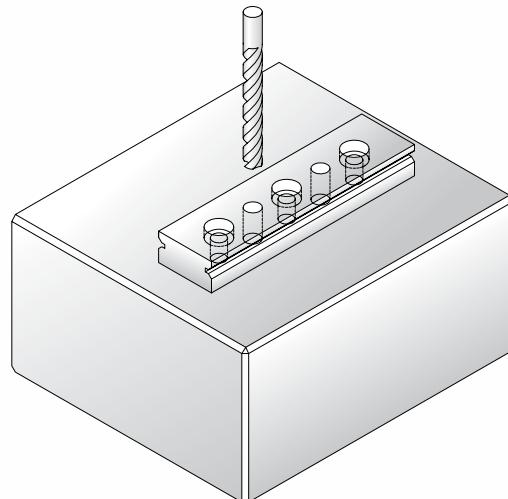

Ends of linear motion rail can be provided with end screws. This feature is intended to prevent retainer falling off during handling. It is not intended for use as a stopping mechanism.

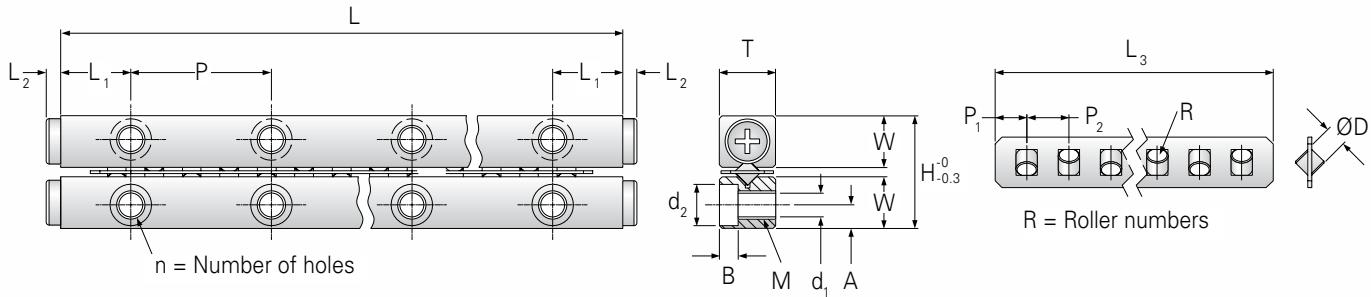

**Overload**

Overloading a Cross Roller/Ball Rail, or applying an unusual collision or hard stop will cause permanent indentation in V-groove and rollers/ball bearings. This will cause non-smooth motion and effect accuracy.

**Matched Sets**

Cross roller rail accuracy is made by matching sets as unit to precisely control its error range. Different sets of cross roller/ball rails mixed in use may result in accuracy variation.

## CROSS ROLLER ASSEMBLIES

Nook Cross Roller Assemblies are composed of a matched pair of Nook Cross Roller Rails to provide highest accuracy and smooth movement.

## SELECTION

1. Select unit width and length
2. Select model per installation
3. Acquire model no. from catalogs
4. Select standard, stainless or corrosion-resisting per environment request

## INSTALLATION SELECTION

## CROSS ROLLER ASSEMBLY INTRODUCTION

### ACCURACY

#### High accuracy

Cross Roller Assemblies are ground to tight tolerance for the highest accuracy possible.

#### Low friction

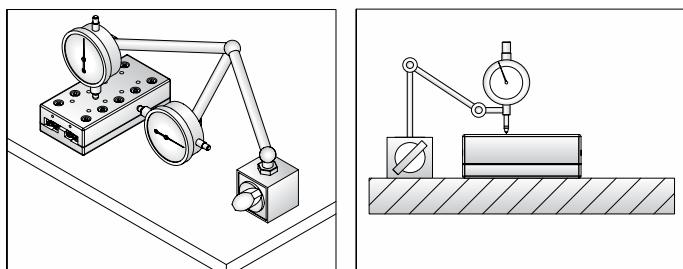

The rollers provide low friction and stable performance in either low speed or high speed applications.

#### High rigidity Compact Size

Cross Roller Assemblies use the Cross Roller Rails providing the height rigidly and load capacity when compared to other linear products.

TABLE ACCURACY INSPECTION LEVEL		RAIL ACCURACY INSPECTION LEVEL	
Table length	Mid-delivery amplitude	Side-delivery amplitude	Straightness
0 ~ 50	0.002	0.004	0.002
50 ~ 100	0.002	0.005	0.002

550 ~ 600	0.004	0.009	0.004

Unit = mm

### RATED LIFE CALCULATION OF TABLE AND PARAMETER CALCULATION FORMULA

$$L = \left( \frac{f_T}{f_w} \times \frac{C}{P_c} \right)^{10/3} \times 100$$

Where:

L = Rated life ( km)

C = Basic dynamic load ( kN)

P<sub>c</sub> = Radial load calculated value ( kN)

f<sub>T</sub> = Temperature factor

f<sub>w</sub> = Load factor

### WORKING LIFE HOURS (L<sub>h</sub>)

After calculating rated life (L), use formula below to calculate working life hours, if stroke length and travel times per minute are constant.

$$L_h = \frac{L \times 10^6}{2 \times l_s \times n_1 \times 60}$$

Where:

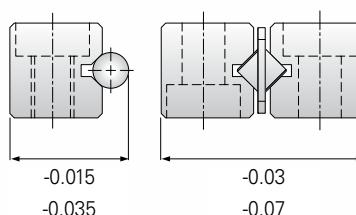

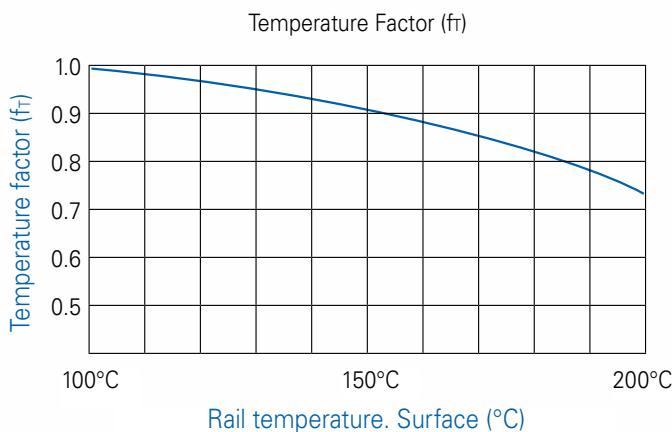

L<sub>h</sub> = Working life hours (h)

l<sub>s</sub> = Stroke length (mm)

n<sub>1</sub> = Travel times per minute (min<sup>-1</sup>)

### f<sub>T</sub> = Temperature factor

Assemblies in an environment over 100°C should be run using high temperature lubricant. Calculate basic rated load × temperature factor as shown below.

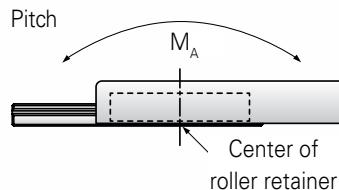

**$f_w$  = Load Factor**

Applications with excessive deceleration or hard stops can cause permanent deformation of the v-guide rails. Use the chart below to consider proper load factor.

**LOAD FACTOR ( $f_w$ )**

Vibration / shock	Speed (V)	$f_w$
Tiny	Dead slow $V \leq 0.25 \text{ m/s}$	1-1.2
Small	Slow $0.25 < V \leq 1 \text{ m/s}$	1.2 - 1.5

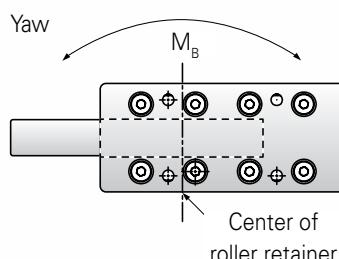

**TORQUE CALCULATION**

**ROLLER QUANTITY = R**

**Roller**

$$M_A = \frac{1}{2} \times \left(\frac{R}{2}\right)^2 C_0 \times P$$

**Roller**

$$M_B = \frac{1}{2} \times (R^2 - R) C_0 \times P$$

**SINGLE STATIC LOAD  
RATING TYPE SELECTION**

**Roller**

$$M_C = \frac{R}{2} \times C_0 \times L_R$$

Sf = Safety factor

**OPERATION INSTRUCTIONS**

**Please operate carefully**

Excessive deformation due to hard stops or crashes may cause permanent damage to the roller guides resulting in non-smooth movement.

**Contamination**

Dust and impurities mixed with components inside linear motion table may cause a decrease in accuracy or reduced life. Set outer dust cover to protect table when used in harsh environment.

**Lubrication**

All linear motion applications require proper lubrication. Abrasion and lack of lubrication will reduce life by 90%.

Function of lubrication:

1. Reduce friction between running parts.
2. Forming oil film on rolling surface to reduce abrasion of metal medium to extend life of rolling elements.
3. Covering on metal surface to prevent rust.

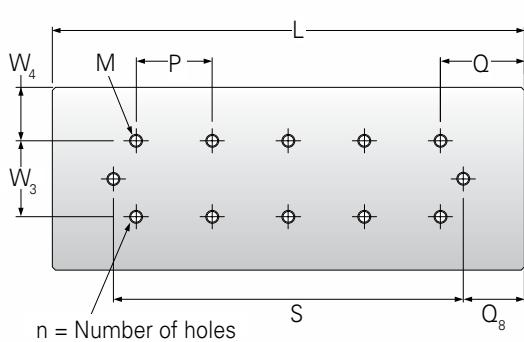

**Deviation of roller retainer**

Nook linear motion tables running in high speed, off-center load or vibration conditions, may cause retainer bending. Normal recommended speeds are below 30m/min. In addition, it is suggested that to minimize bending of the roller retainer, the assembly should be cycled full stroke to center the roller retainer while running.

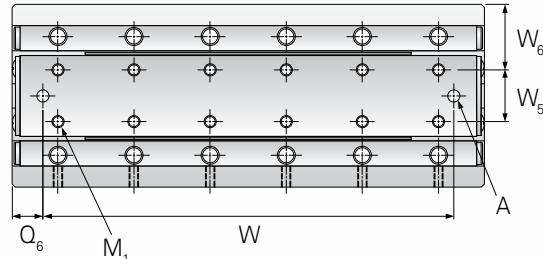

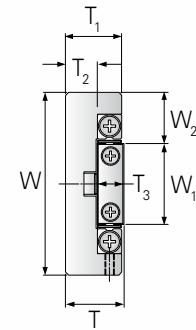

**Preload adjustment**

Nook linear motion tables are factory set. No preload adjustment required.

## LUBRICATION COMPATIBILITY

To prevent lubrication incompatibility problems, avoid mixing lubricants of varying thickeners. Combining lubricants of incompatible thickeners can cause an increased risk of functional and physical problems, such as; viscosity and shear instability, oil filtration and oxidized breakdown, along with increased oil leakage.

If two lubricants with different thickeners are required, the below chart will help in determining compatibility.

Compatibility comparison of different thickeners are as follows:

●	Fully Compatible
○	Semi Compatible
✗	Incompatible

	Barium Based	Calcium Based	Clay Based	Lithium Based	Urea Based	COMPLEX			12HSA*	
						Aluminum	Calcium	Lithium	Calcium	Lithium
Barium Based	●	●	●	●	●	●	●	●	✗	●

## SLIDE SYSTEM FEATURES

A Nook Series slide assembly is truly a "System" not simply a "Component". The matched components used in Nook Slides result in better system performance. When Nook Slides Systems are used as sub-assemblies, setup and alignment time is reduced. Nook Slide Systems are easier to specify and to order.

Precision carriage plates supplied with Series 100 and 200 help prevent misaligned shafts and bearings. Aluminum carriage plates include threaded steel inserts at key mounting locations. Protective, non-corrosive finish on all exposed non-wear components. Nook Slide Systems have been engineered by Nook Industries for use in the following applications:

- Product packaging
- Electronics manufacturing
- Food processing
- Machine tool equipment
- Component assembly
- Material handling
- Converting processes
- Container manufacturing
- Medical equipment
- Textile industry
- Automated test equipment

Contact Nook Industries to discuss special requirements.

Modifications include:

- Special screws (ground thread, precision rolled with preloaded nuts, high lead screws, metric lead screws, etc.)
- Protective boots in a variety of materials (neoprene, metallic, etc.)
- Special motor mounts with Servos motors, steppers motors and drives
- Custom carriage machining

### SERIES 100 SLIDE SYSTEM

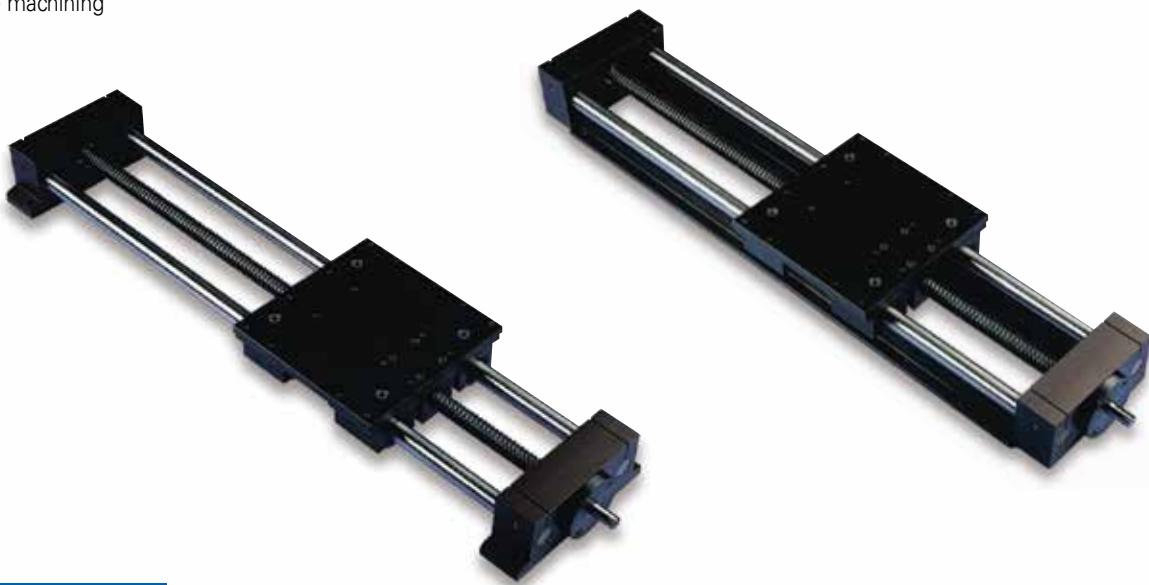

Nook Series 100 slide systems are pre-assembled and ready to mount. Series 100 slides consist of combinations of Nook Linear Ball Bearing Pillow Blocks, HG shafting, carriage plates and shaft supports. Aluminum carriage plates include threaded steel inserts at key mounting locations. All exposed non-wearing components have a protective, corrosion resistant finish.

### SERIES 200 SLIDE SYSTEM

Nook Series 200 slide systems are assembled slides which include:

- Linear Bearing Pillow Blocks
- Integrated end supports
- HG linear shafts
- Carriage Plate
- Nook Ball Screw Assembly or Acme Screw Assembly

Many options are available for these slide systems. Different screw styles and leads, protective boots, special motor mounts and custom carriage plate machining is available. Contact Nook Industries for assistance.

## LINEAR SHAFTING FEATURES

### SURFACE FINISH

Nook HG shafting is centerless ground to a consistently smooth surface finish of 14 micro inches rms or less. Excellent surface finish and hardness maximize the efficiency and life of linear bearings.

End

Horizontal

### STRAIGHTNESS

Nook HG shafts are straight within 0.002 of an inch per foot cumulative when shipped from the factory. Handling or machining of shafting can cause the material to bend.

### PRE-DRILLED & TAPPED HOLES

Nook HG alloy shafting is stocked with radial holes drilled and tapped to accept a continuous shaft support rail. Continuous support prevents shaft deflection when used to support heavy loads or for long travel lengths. Radial holes can be supplied in stainless steel shafts from  $\frac{1}{2}$ " to 2" diameter.

### PRECISION END MACHINING

Nook HG shafting can be supplied pre-machined to application requirements. Send a detailed sketch or blueprint for a prompt quotation. See page 200-201 for descriptions of machining offered by Nook Industries. Templates for machining are available on our website: [www.nookindustries.com](http://www.nookindustries.com).

### LENGTH TOLERANCE

Nook HG shafting cut to your specified length will have a standard length tolerance of  $+\frac{1}{32}$ " up to 2" diameter and  $\pm\frac{1}{16}$  above 2" diameter. Closer tolerances are available for an additional charge. Non-precision chamfered ends are standard on all cut shafting.

### SHAFT SUPPORTS

Aluminum support components for end mounting or continuously supporting Nook HG shafting are available for inch sizes  $\frac{1}{2}$ " to 2".

### SELF-ALIGNING PILLOW BLOCKS

Nook Pillow Blocks simplify mounting of Nook Linear Bearings. They are available with Excel™ Bearings to fit shafts from  $\frac{1}{4}$  to 2 inch and 10 to 50mm. Nook Pillow Blocks provide the precision bearing bores necessary for linear bearing installation.

### MOUNTING TOLERANCES

The Nook Pillow Block mounting surface to center line dimension is held to  $\pm 0.001$  inch. Bearings will self-align up to  $\pm\frac{1}{2}^{\circ}$ .

### MATERIALS

All Nook Pillow Blocks are manufactured from precision machined, thick walled, extruded aluminum.

### PILLOW BLOCK SEALS

Nook Pillow Blocks are supplied complete with lip seals. The sealed pillow block keeps lubricant in and dirt and debris out, resulting in smoother operation and longer bearing life.

## BEARING DESIGN CONSIDERATIONS

### APPLICATION VARIABLES

To determine the best linear bearing product or system for your application it is necessary to know:

- Amount of load
- How the load is applied
- Length of stroke

### COEFFICIENT OF FRICTION

Nook linear bearings exhibit an extremely low coefficient of friction ranging from 0.0008 to 0.0035. Coefficients of static and rolling friction are used to estimate the force required to overcome frictional resistance. The formulas for determining static and rolling frictional resistance are:

#### STATIC FRICTION:

$$F_s = L \times f_s$$

#### ROLLING FRICTION:

$$F_d = L \times f_d$$

Where:

$F_s$  = Static frictional resistance (lbs)

$F_d$  = dynamic frictional resistance (lbs)

L = applied radial load (pounds)

$f_s$  = coefficient of static friction

$f_d$  = coefficient of rolling friction

The tables show the coefficients of friction for Nook Linear Bearings operating on hardened and ground shafts of recommended diameters. (See FIG. 4)

There are other variables that affect the dynamic frictional resistance of linear bearings. These variables include:

**Lubrication** Dry linear bearings exhibit the lowest coefficient of friction. Friction values for lubricated bearings are higher due to the presence of lubricant surface tension.

**Seals** Non-linear seal drag occurs because of the geometry and the materials used in the bearing seals.

**Contamination** Foreign particles restrict free rolling of the bearing balls and will contribute to an increase in dynamic frictional resistance.

### LUBRICATION

A lubricant formulated for rolling friction should be used with Nook Linear Bearings. In applications where operating speeds are low and loads are light, Nook linear bearings can be used without lubrication at a reduced life. However, to protect the highly polished bearing surfaces from corrosion and wear, a lubricant is recommended.

Where linear speeds are high, a light oil should be used and provision for re-lubrication should be made to avoid operating the bearings dry. For typical applications, a medium to heavy oil has good surface adhesion and affords greater bearing protection. Linear Bearings of 2" diameter and above may use high pressure lithium grease such as Shell Alvania #2 for moderate speed applications. Lubricants containing additives such as molydisulfide or graphite should not be used.

Nook Linear Lube LBL-1 liquid is a good, all purpose lubricant for use with linear bearings. See page 198 for more information.

### MAXIMUM AND NORMAL LOAD RATINGS

The required design life, the shaft hardness, and a bearing dynamic load rating affect the load that can be applied to a Nook linear bearing. Two dynamic load ratings are given for each bearing size based on the rotational orientation of the bearing.

#### Normal Load Rating

Normal load rating is used in applications where the orientation of the ball tracks relative to the load cannot be controlled. The Normal load rating is based on a load imposed directly over a single ball track. The Normal load rating shown in the specification tables is slightly greater than would be mathematically calculated based on one track loading because it assumes that the load is shared to some degree by one or more of the adjacent ball tracks.

FIG. 4

COEFFICIENTS OF STATIC FRICTION ( $f_s$ )				
Type of Bearing Lubrication	Load In % Of Rated Load			
	100%	75%	50%	25%
Any	.0024	.0026	.0029	.0035

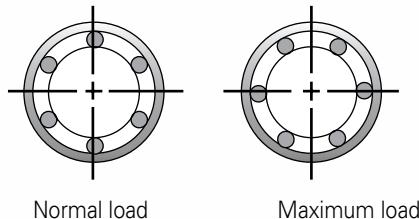

COEFFICIENTS OF ROLLING FRICTION ( $f_d$ )				
Type of Bearing Lubrication	Load In % Of Rated Load			
	100%	75%	50%	25%
None	.0008	.0009	.0013	.0018
Oil	.0012	.0013	.0016	.0021
Grease	.0013	.0015	.0019	.0026

## BEARING DESIGN CONSIDERATIONS

### MAXIMUM LOAD RATING

The Maximum load rating assumes that the load is applied midway between two ball tracks as illustrated below. In this orientation the load is distributed over the maximum number of bearing balls. (See FIG. 5)

FIG. 5

### LOAD LIFE DETERMINATION

The Normal and Maximum load ratings are based on a Rc 60 shaft hardness and a travel life of two million inches. For linear bearing system operating at less than full rated load, the Load-Life Curve may be used to determine the travel life expectancy. (See FIG. 7)

### SHAFT HARDNESS

If shafting other than standard alloy Nook HG shafting is used, the Shaft Hardness Curve establishes a shaft hardness correction factor, Rh. When calculating the equivalent load, this factor compensates for the effect of hardness. (See FIG. 6)

FIG. 6

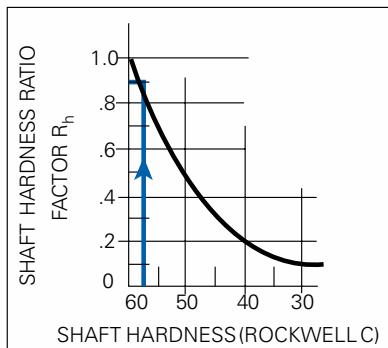

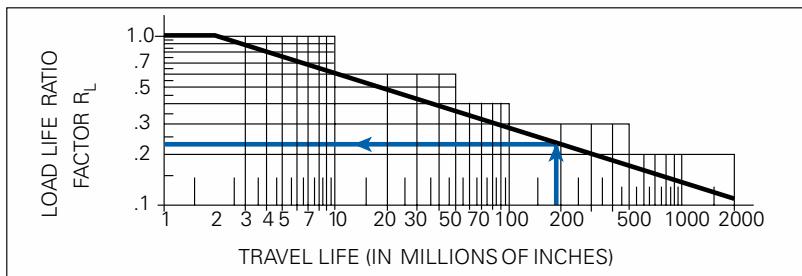

FIG. 7

### EQUIVALENT LOAD

An equivalent load value can be calculated when sizing linear bearings for applications at conditions other than maximum rating.

Equivalent Load Formula:

$$L_e = L_a / (R_L \times R_h)$$

Where:

$L_e$  = Dynamic Equivalent Load (The minimum bearing capacity to meet design life requirements)

$L_a$  = Applied Load (Actual Load)

$R_L$  = Load Life Ratio Factor (from chart)

$R_h$  = Shaft Hardness Ratio Factor (from chart)

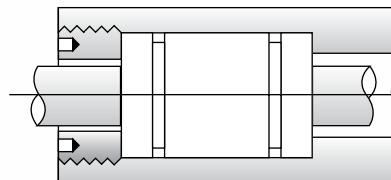

### BEARING INSTALLATION

In most installations, Nook linear ball bearings are designed to slip-fit into the housing bore and be secured by one of the following means:

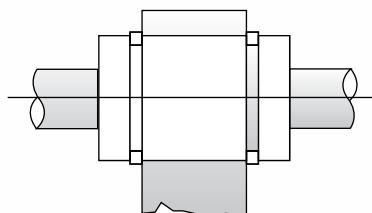

- Between an internal housing shoulder and a threaded cap.
- Between external retaining rings.
- Between internal snap rings in the bore of the housing.

The bore diameter required to maintain recommended bearing/ shaft clearance is given in the Excel™ linear bearing information section. The bore does not affect clearance between an LBB bearing and a shaft. (See FIG. 8)

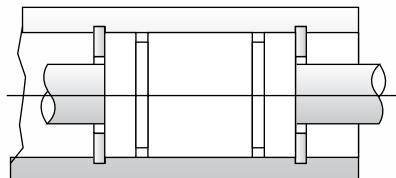

FIG. 8

Between an internal housing shoulder and a threaded cap.

Between external retaining rings.

Between internal snap rings in the bore of the housing.

## SLIDE SYSTEM DESIGN CONSIDERATIONS

### ASSEMBLY EXCESSIVE FIT

Oversized shaft diameters or misalignment between the installed bearings can cause preload between the shaft and the bearing. Preload conditions should be corrected before operating the bearing. If, in an assembled unit, the shaft can freely rotate relative to the bearing, then the fit is at the maximum or less.

### SYSTEM DESIGN CONSIDERATIONS

#### Single Or Double Shaft Systems

The majority of applications require double shaft systems in order to restrain the load in two planes. Single shaft systems may be used for hanging or vertical loads where rotation of the bearing around the shaft is allowable.

#### FULLY SUPPORTED OR UNSUPPORTED SHAFTS

Fully supported systems are used to eliminate shaft deflection. Full shaft supports must be attached to a machined mounting base. Open style bearings used with this system are sensitive to load orientation.

End-supported systems are generally used to span a gap or where some deflection is allowable. This system uses closed-style bearings that achieve higher load capacities. The shaft must be selected so that deflection does not exceed self-alignment capability of the bearing.

#### LINEAR BEARING PILLOW BLOCKS

Two bearings must be used to support a load on a shaft. Single blocks allow for custom spacing and wider load bearing stances. Twin pillow blocks have a compact, one-piece design.

### BEARING/SHAFT SIZE

For fully supported systems the bearing size needed for the application is determined by the load and life requirements. For end-supported systems, both the bearing diameter that meets load and life requirements and the shaft diameter that results in an allowable deflection must be determined. The correct choice of shaft/bearing diameter is the larger of the two.

### LOAD CONDITIONS

Linear systems require at least three bearings to define the plane of motion. It is necessary to identify and understand which of following load conditions affect the application:

- Centered Loads
- Offset loads
- Side Loads
- Vertical Loads
- Gravity Effects
- Reaction Forces (i.e., cutting tool reaction)
- Dynamic Loading (acceleration, deceleration and inertial loads)

### CARRIAGE PLATES

Carriage plates are designed in two styles for linear system packages.

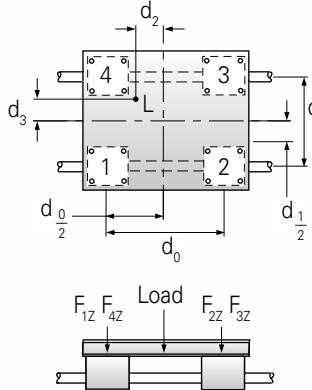

Carriage 1 is designed for two pairs of single bearing blocks.

Carriage 2 is designed for two twin bearing blocks and has a shorter over all length.

## SLIDE SYSTEM DESIGN CONSIDERATIONS

Apply the actual load to the appropriate load condition in the figure below to calculate the resulting bearing loads. (See FIG. 10)

FIG. 10

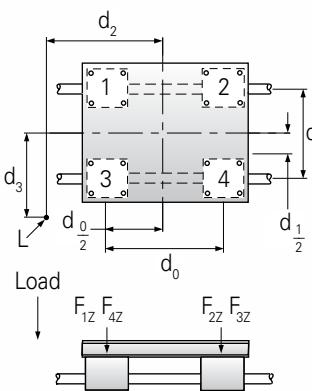

### Load Centered

$$F_{1Z} = \frac{L}{4} + \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) - \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

$$F_{2Z} = \frac{L}{4} - \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) - \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

$$F_{3Z} = \frac{L}{4} - \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) + \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

$$F_{4Z} = \frac{L}{4} + \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) + \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

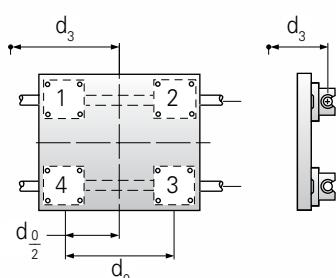

### Load Offset

$$F_{1Z} = \frac{L}{4} + \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) - \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

$$F_{2Z} = \frac{L}{4} - \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) - \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

$$F_{3Z} = \frac{L}{4} - \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) + \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

$$F_{4Z} = \frac{L}{4} + \left(\frac{L}{2} \times \frac{d_2}{d_0}\right) + \left(\frac{L}{2} \times \frac{d_3}{d_1}\right)$$

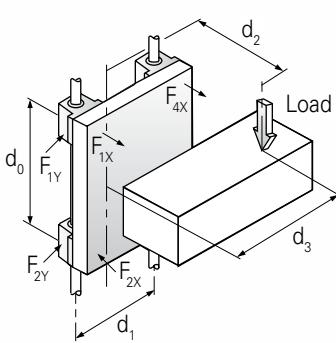

### Side Mounted

$$F_{1Y} = F_{4Y} = \left(\frac{L}{2} \times \frac{d_2}{d_0}\right)$$

$$F_{1Z} = F_{4Z} = \frac{L}{4} + \left(\frac{L}{2} \times \frac{d_2}{d_0}\right)$$

$$F_{2Z} = F_{3Z} = \frac{L}{4} - \left(\frac{L}{2} \times \frac{d_2}{d_0}\right)$$

### Vertical Mounted

$$F_{1X} = F_{4X} = \left(\frac{L}{2} \times \frac{d_2}{d_0}\right)$$

$$F_{1Y} = F_{4Y} = \frac{L}{4} + \left(\frac{L}{2} \times \frac{d_2}{d_0}\right)$$

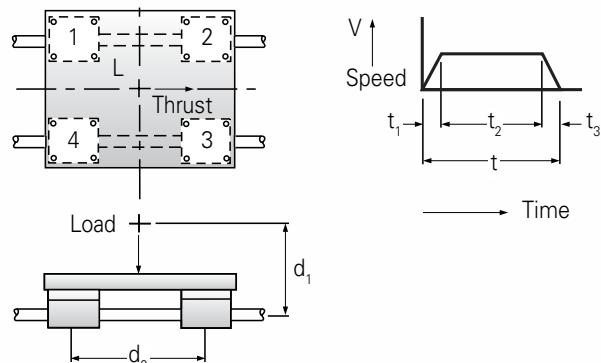

$$F_{1X} + F_{4Y} = F_{2X} + F_{3X}$$

$$F_{1Y} + F_{4Y} = F_{2Y} + F_{3Y}$$

## ACCELERATION FORCES

Use the equation in the following figure to determine the additional forces developed due to acceleration. If impact or impulse loads are anticipated, these forces must also be considered when selecting the appropriate bearing size. (See FIG. 11)

AT THE TIME OF ACCELERATION AND SLOW DOWN FIG. 11

At the time acceleration starts:

$$F_1 = F_3 = \frac{L}{4} \left(1 + \frac{2V_1 \times d_1}{g \times t_1 \times d_0}\right)$$

$$F_2 = F_4 = \frac{L}{4} \left(1 - \frac{2V_1 \times d_1}{g \times t_1 \times d_0}\right)$$

At constant velocity:

$$F_1 = F_2 = F_3 = F_4 = \frac{1}{4} L$$

At the time it slows down:

$$F_1 = F_4 = \frac{L}{4} \left(1 - \frac{2V_1 \times d_1}{g \times t_1 \times d_0}\right)$$

$$F_2 = F_3 = \frac{L}{4} \left(1 + \frac{2V_1 \times d_1}{g \times t_1 \times d_0}\right)$$

Gravitational acceleration:

$$g = 384 \text{ in./sec}^2 = 9.8 \text{ m/sec}^2$$

## SHAFT DEFLECTION

Shaft deflection should be considered when choosing the proper bearing and shaft diameter for end-supported systems. Deflection is directly related to the diameter of the shaft, the unsupported length of the shaft, and the type of shaft end mounting that is used.

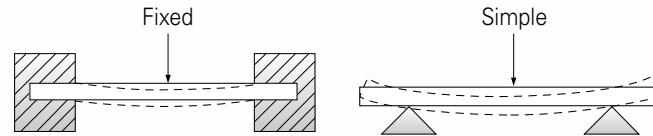

Typical Shaft End Mounting. (See FIG. 12)

"Simple" - the end allows some of the shaft deflection slope through the fastening point.

"Fixed" - the ends are constrained from deflection.

**NOTE:** Fixed end mounting can be accomplished by capturing the shaft end with a length of engagement equal to or greater than 1½ times the shaft diameter.

FIG. 12

## SYSTEM DESIGN CONSIDERATIONS

### DEFLECTION CALCULATION

Use the formula:

$$D = N \times W \times L^3$$

Where:

N = value from FIG. 13

W = load in pounds

L = length (in inches) of unsupported shaft section

FIG. 13

<b>"N" VALUE FOR NOOK SHAFTS</b>		
<b>Shaft Diameter (in)</b>	<b>Simple</b>	<b>Fixed</b>
1/4	$3620 \times 10^{-9}$	$905 \times 10^{-9}$
5/8	$715 \times 10^{-9}$	$179 \times 10^{-9}$
1/2	$226 \times 10^{-9}$	$56.6 \times 10^{-9}$
3/4	$44.7 \times 10^{-9}$	$11.2 \times 10^{-9}$
1	$14.1 \times 10^{-9}$	$3.54 \times 10^{-9}$
1 1/2	$2.79 \times 10^{-9}$	$.698 \times 10^{-9}$
2	$0.866 \times 10^{-9}$	$.0220 \times 10^{-9}$
3	$0.168 \times 10^{-9}$	$.432 \times 10^{-10}$
4	$0.052 \times 10^{-9}$	$.136 \times 10^{-10}$

### APPLICATION EXAMPLES

#### Application #1 – Packaging Line

An appliance manufacturer needs to move products in boxes so that they can be presented to a transfer conveyor after final assembly.

##### Specifications:

- The boxes weigh 200 pounds
- The unit reciprocates 8 times per minute
- 4.5 inch stroke
- 365 days per year, ten year design life
- Slightly corrosive environment

What is the proper size Excel™ Bearing which will satisfy this application?

##### Analysis:

Configuration: There is enough space available for four linear bearings. The system will use stainless steel shafting with a hardness of Rc 55. The load can be centered between four standard Excel™ linear bearings.

##### Travel Life:

4.5 in. / stroke  $\times$  8 strokes / min.  $\times$  60 min. / hr  $\times$   
24 hrs. / day  $\times$  365 days / year  $\times$  10 years = 189,000,000 inches.

### CALCULATE MISALIGNMENT ANGLE

Nook linear bearings allow for ½ degree misalignment. To determine the amount of misalignment due to shaft deflection use the formula:

$$\theta = \sin^{-1} (D/L)$$

Where:

$\theta$  = angle in degrees

D = shaft deflection

L = length (in inches) of unsupported shaft section.

If misalignment is greater than ½ degree, then:

- Reduce the Length of the shaft
- Use a larger shaft diameter

##### Shaft Hardness Ratio Factor ( $R_h$ ):

For Nook HG Stainless shafting with a hardness of Rc 55,  $R_h = .70$

##### Applied Load ( $L_a$ ):

Per bearing,  $L_a = 200/4 = 50$  lb

##### Equivalent Load ( $L_e$ ):

Substituting in the load formula and solving for  
 $L_e = 50 / (.22 \times .70) = 325$  lb

##### Selection:

From the Excel™ Bearing load tables, the smallest bearing which exceeds this load rating is the ¾ inch bearing. However, if the application is such that the bearing could be oriented for maximum capacity, then the ½ inch bearing could be used.

##### The Parts List Is:

- 4 XLEC12 Excel™ Linear bearings
- 2 Nook HG Stainless shafting
- 9.25 inch minimum length
- 2 Nook NSB-12 End supports

##### Load-Life Ratio Factor (RL):

Based on the computed travel life and the load-life curve  $R_L = .22$ .

## Application #2 – Scanner Positioning

A vision system scanner is mounted to the center of the carriage of a vertically mounted slide system. The customer wants to use one inch open pillow blocks to guarantee a long life.

Specifications:

- Scanner weight is 100 pounds
- The center of gravity is offset 4 inches from the carriage plate
- The adjustment distance is 36 inches
- Minimal deflection desired
- Hand adjustment with future automation planned
- A travel life of 10 million inches is desired

### Analysis:

Configuration: A standard system with carriage plate and fully supported shafts will assure minimal deflection.

### Load Per Bearing:

The load is centered and offset four inches. Use the equations from the load condition figure "Vertically Mounted" to determine the worst case force through a bearing. The distance from the load to the center line of the shaft ( $d_2$ ) is  $4 + 1.187$  or  $5.187$  inches. The bearing spacing ( $d_0$ ) is set by the carriage plate;  $d_0 = 7$  inches. Based on a design factor of 2, the load per bearing is 74 pounds. This is far below the rated value of a one inch open bearing.

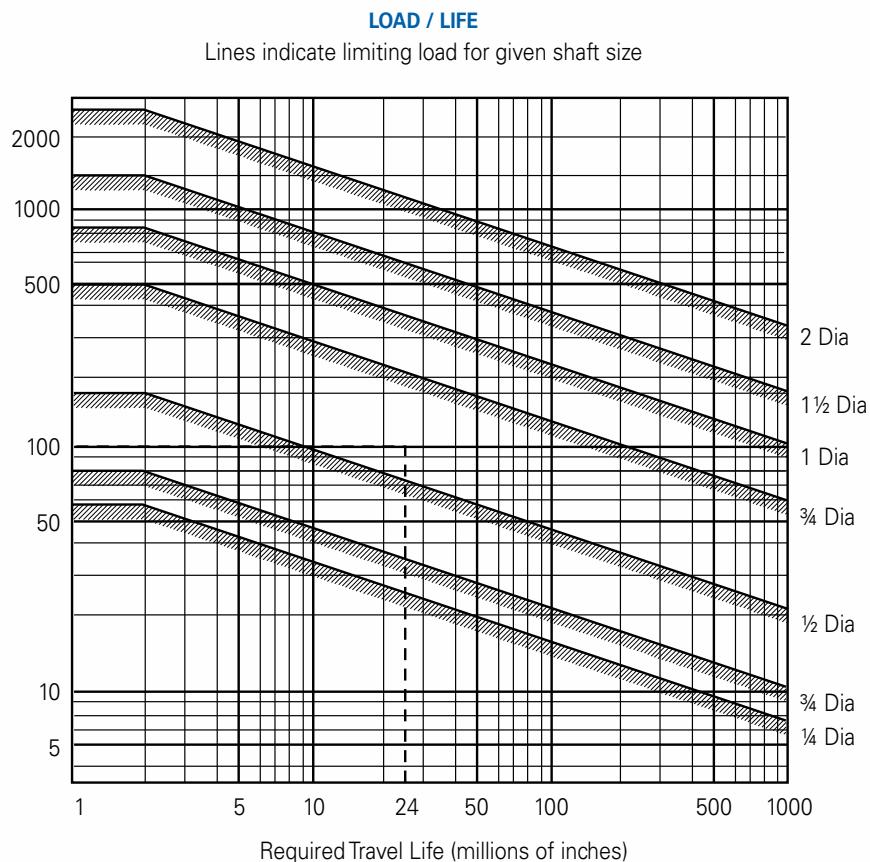

**NOTE:** When using open-style bearings, if the direction of loading force is through the opening of the bearing, it is necessary to de-rate the bearing capacity by 50%.

### Selection:

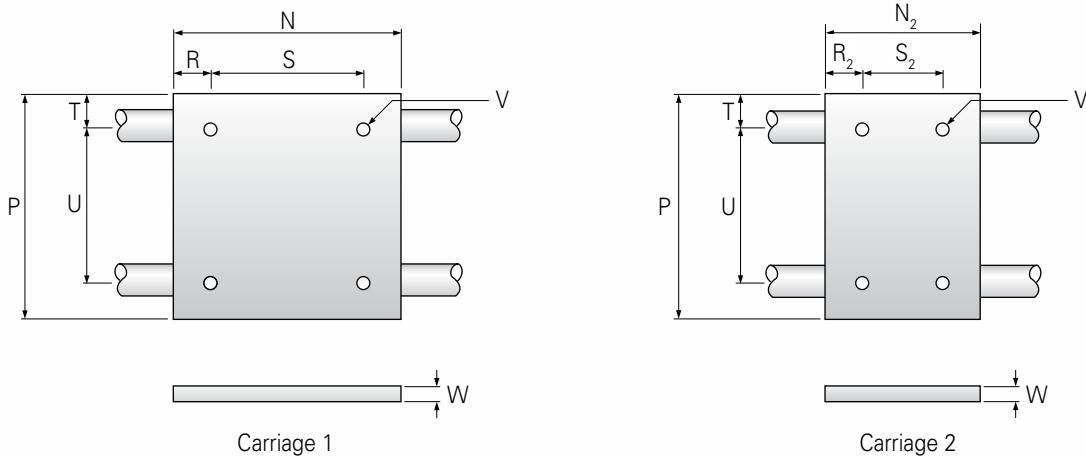

Nook Series 133 consisting of a double shaft fully supported system with Carriage 1 and four (4) single bearing blocks.

The Parts List is:

133-16-L36

## SERIES 200 OVERVIEW

All Nook Precision Slides can be supplied with Stepper Motors, Servo Motor Drives and controllers. Contact factory engineers.

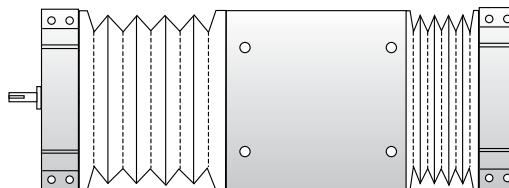

### MOTOR ADAPTORS FOR 212

Slide Part No.	Frame Size	Dimension (in)			
		A	B	C	D
-08	23	1.86	2.25	2.25	1.65
-12	23	1.86	2.25	2.25	1.85
-16	34	2.74	3.25	3.25	2.75
-24	42	3.50	4.25	4.25	2.98

### MOTOR ADAPTORS FOR MM SLIDE

Slide Part No.	Frame Size	Dimension (in)			
		A	B	C	D
012-06	23	47.25	572	572	40.9

Contact Nook Industries for additional sizes.

### NOOK SLIDE SYSTEM MOTOR ADAPTERS

Allows for direct connection of a motor to a slide. Custom configurations are available, contact Nook Industries.

- Coupling is included
- Available for Series 212 & 252
- Aluminum construction

### NOOK SLIDE SYSTEM BELLows BOOTS

Protects slide components from contaminants. Custom configurations are available, contact Nook Industries

- Available for Series 212 and 252
- PVC coated nylon
- Boot is fastened to the end blocks and carriage plate with hook and loop fasteners

### EXAMPLE 212-08-LXX with 24" Travel:

$$L = (\text{Travel} + 8.5") + \text{Ret. Boot} + \text{Ret. Boot}$$

$$39.7" = (24" + 8.5") + 3.6" + 3.6"$$

(See pages 184 and 185 for 212 and 252 Series min "L" dimension.)

**NOTE: Travel must be adjusted to accommodate retracted boot.**

Calculation per each boot is:

$$\text{Retracted Boot} = (\text{Travel} \times .14") + .25$$

## PTPS PRECISION PROFILE RAIL SLIDE

Nook Industries offers a cost effective solution for design applications that demand precise positioning...even during rapid travel rates: Nook Precision Slides.

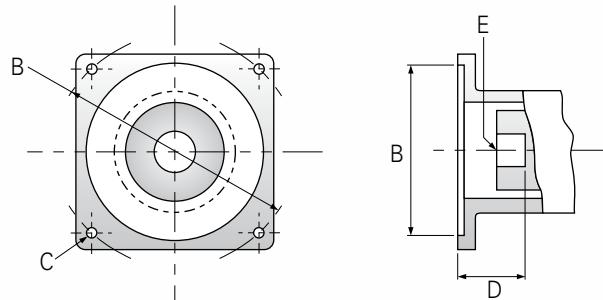

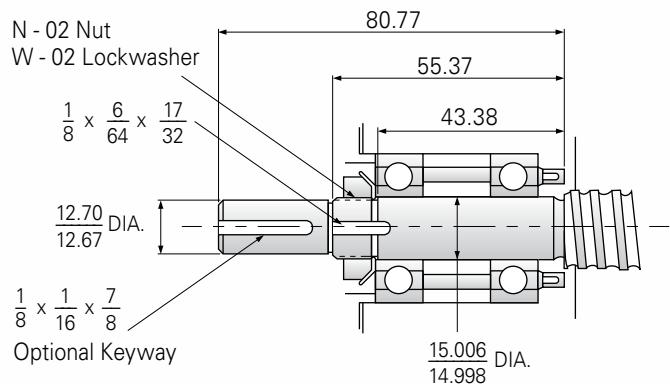

These high performance machine slides are precision-engineered for machine tool, robotic, food processing, metalworking and precise material handling applications.

The ball screw driven precision slides are rigidly constructed and compact-designed to hold load capacities. Nook Precision Slides incorporate low friction, smooth profile rails for super accurate linear travel with zero-backlash.

The high load carrying capacity of the Nook Precision Slide allows it to dramatically outperform standard bushing-type ball bearing slides.

Nook Precision Slides are conveniently available in lengths up to 72 inches with many different ball screw configurations possible, including precision ground ball screws. This versatility allows for custom tailored speed and accuracy capabilities to meet your most demanding design requirements.

- Accurate position
- High speed
- Heavy loads
- System friendly
- Rigid construction

## LINEAR BEARINGS

Nook Industries manufactures a full range of linear slide systems and slide system components. The Nook line of linear components includes solid shell LBB linear bearings, self-aligning Excel™ linear bearings, HG Hardened and Ground Shafting, Pillow Blocks and complete slide systems.

## LINEAR BEARING TYPES & LINEAR SHAFTING

### LINEAR BEARING TYPES

#### Excel™ Linear Bearings

Designed to fit into precision bores, these bearings are self aligning and offer long life. Precision hardened and ground bearing plates with conforming ball tracks are contained in a molded thermoplastic housing.

#### LBB

These bearings are used in lower load applications where self alignment is not required. The precision fit between the bearing and shaft is built into the bearing as a result of the solid steel shell. These bearings utilize a molded plastic ball retainer assembled inside a hardened and ground shell.

#### Open Series Bearings

For applications requiring fully supported shafts, "open" bearings are available in both LBB and Excel™ types. In an open bearing, one ball circuit is removed to allow the mounted bearing to translate along a supported shaft.

#### Seals

LBB and Excel™ bearings are available in sealed and unsealed versions. ILBB bearings are unsealed.

#### Materials

Nook linear bearings use a combination of high performance thermoplastic, chrome-steel bearing balls, and either a one piece hardened steel shell or precision ground hardened steel bearing plates. (See FIG. 1)

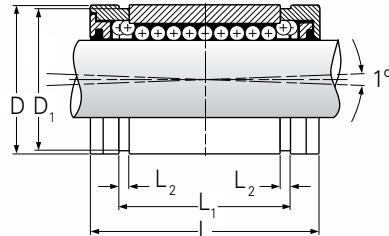

FIG. 1

	BALLS	BEARING PLATE	BALL RETAINER	END RINGS	INTERNAL SEALS
<b>Excel™ Self - Aligning</b>	Hardened Chrome Steel	Hardened Steel	N/A	N/A	Nitrile
<b>LBB SERIES</b>	Hardened Chrome Steel	N/A	Acetal Resin	Steel Black Oxide	Nitrile

FIG. 2

IMPACTS & VIBRATIONS	SPEED	ACCELERATION (G)	LOAD FACTOR ( <i>f</i> )
<b>Without external impacts or vibrations</b>	Velocity 50 ft/min	Acceleration < 0.5G	1 ~ 1.5
<b>Without significant impacts or vibrations</b>	Velocity > 50 ft/min and 190 ft/min	Acceleration > 0.5G and 1.0G	1.5 ~ 2.0
<b>Without external impacts or vibrations</b>	Velocity > 190 ft/min	Acceleration > 1.0G and 2.0G	2.0 ~ 3.5

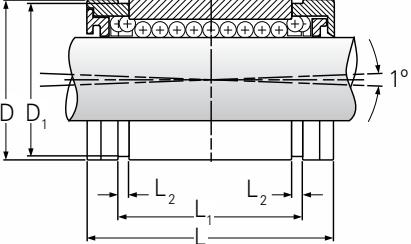

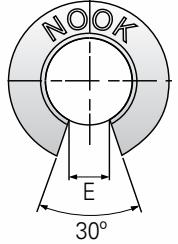

## EXCEL™ SELF ALIGNING BEARINGS OPEN & CLOSED

- Designed for use on end supported Nook HG "L" shafting
- Bearings are available with or without shaft seals.

### INCH - CLOSED BEARINGS

## EXCEL™ PILLOW BLOCKS FLANGE-MOUNT SINGLE & TWIN

Excel™ Linear Bearings provide high efficiency and smooth operation in a variety of linear guidance applications. Excel™ Flange-Mount Pillow Blocks offer an installation alternative to standard foot-mount pillow blocks when the mounting surface is perpendicular to the guide shafts. Nook Industries flanged mount pillow blocks are available in both single and twin bearing styles

and include  $\frac{1}{2}$ ,  $\frac{3}{4}$  or 1 inch Excel™ Linear Bearings. The blocks have integral lip seals, an aluminum housing and a lubrication port. Typical applications include: platform guidance, end stop support, conveyor width adjust mechanisms, edge guides and machine operator guards.

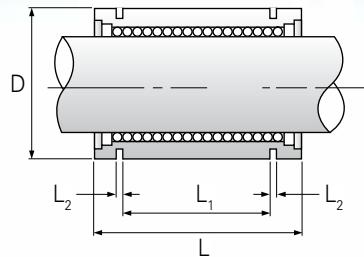

- Sealed at both ends, contains unsealed Excel™ Bearing (two bearings in twin)
- Designed for use on end supported Nook HG "L" shafting

## LINEAR BEARINGS

### SEAL SPECIFICATIONS

Nook Linear Bearing Seals are designed for use in custom housings where additional sealing is desired. They are made of a synthetic rubber compound to allow smooth linear motion with maximum sealing efficiency.

### LUBRICATION

#### Prolong Bearing Assembly Reliability and Life

Lubrication is the key to continued performance and reliability of bearing assemblies. LBL-1 is a multi-purpose pure synthetic lubricant. The stable and predictable chemical properties of LBL-1 help it last longer and outperform conventional petroleum based greases and oils. Lubricant additives fill microscopic surface irregularities to form a smooth, lubricated surface.

#### LBL-1 Lubricant Features And Benefits

- Synthetic, non-toxic, odorless
- Low coefficient of friction
- Free flowing down to -40°
- USDA H-1 rating
- Water and saltwater Resistant
- Won't drip, run or evaporate
- Inhibits rust and corrosion
- Long lasting
- Reduces friction and wear

#### LBL-1 SPECIFICATIONS

Iso Grade	220
Penetration (Worked)	285
Dropping Point	N/A
Gelling Agent	Synthetic
Timken Ok Load	40 lb
Oil Viscosity	cst @ 400C      118-122 cst @ 1000C      14-17
Temperature Range	-45° F TO 450° F

#### LBL-1 4 OZ. LIQUID BEARING BOTTLE

#### LBL-1 SPECIFICATIONS

Part Name	LBL-1
Net Contents Per Unit	4 oz.
Part # NLU-1006	1 BOTTLE weight of 4 oz.
Part # NLU-2006	1 CASE with 12 Bottles total weight of 3 lb

## PRECISION HG SHAFTING

### HG HARDENED AND GROUND SHAFTING

Nook HG Shafting, made from high quality alloy steel, is manufactured and stocked for immediate shipment in our Cleveland, Ohio facility, in diameters from 5 to 80mm and  $\frac{1}{4}$  to 4 inches. Stainless Steel shafting is available from  $\frac{1}{4}$  thru 2 inch diameter.

Standard diameters can be cut to your specified length and shipped within 24 hours of receipt of your order. Contact Nook Industries, Inc. for availability of special diameters.

### CASE HARDNESS

Nook HG alloy shafting is induction hardened Rc 60-63. Stainless steel shafting is hardened to Rc 50-55. Instrument series shafting is hardened to Rc 55-60. The case depth on all Nook HG Shafting is precisely controlled for optimal performance. The extremely hard surface minimizes wear and is resistant to nicks and scratches.

## PRECISION END MACHINING

Nook HG hardened and ground shafting is manufactured for use with precision linear bearings and other applications requiring an accurate, round, hardened shaft or guide rod. All linear shafting

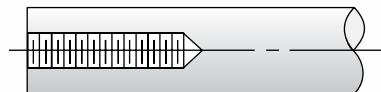

can be machined by Nook Industries to any of the configurations detailed below. Templates for machining are available on our website: [www.nookindustries.com](http://www.nookindustries.com)

### RADIAL HOLES DRILLED AND TAPPED

Radial drilled and tapped holes are available with either UNC or UNF Class 2B thread. The hole alignment and location tolerance is  $\pm .010"$ .

### COAXIAL HOLES

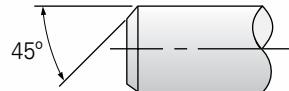

Coaxial holes are machined with concentricity of  $.005"$  centered in the shaft end for shafting  $\frac{1}{2}$  inch diameter and larger. UNC or UNF Class 2B internal threads are available. Based on tapped hole size, some ends may require annealing and will remain soft on the outside diameter.

### RETAINING RING GROOVES

Retaining ring or other grooves area available for all diameter shafting. Annealing may be required in the machined area.

### OPTIONAL MACHINED CHAMFER

Cut shafts are supplied with Nook non-precision standard end chamfers. Specific chamfer dimensions may be specified.

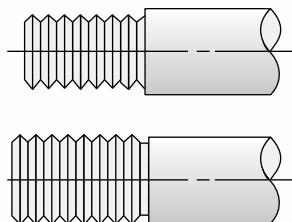

Nook Linear Shafting and Bearings used to guide a loader for medical waste processing.

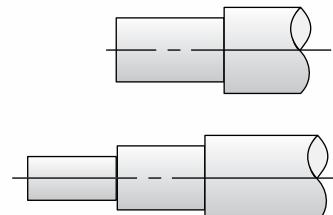

Nook Linear Shafting and Bearings used as guidance in a medical application.

#### THREADED DIAMETERS

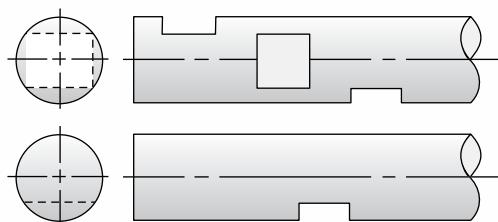

Either the major diameter or reduced diameter may be threaded to UNC or UNF Class 2A. Threaded areas will not have full depth of hardness.

#### REDUCED DIAMETER

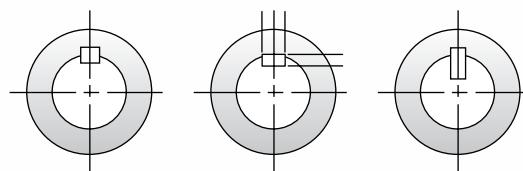

Single or multiple-step machined diameters are available. Concentricity held to within .002". The reduced diameters will not have full hardness.

#### FLATS – SINGLE OR MULTIPLE

Flats have a location tolerance of  $\pm \frac{1}{64}$ ". Multiple flats available on single plane or different planes with location tolerance  $\pm \frac{1}{64}$ ". Contact Nook Industries for flat length limits.

#### KEYWAYS

Keyways are available for square, rectangular or ANSI Standard Woodruff keys. Keyway will not have full hardness.

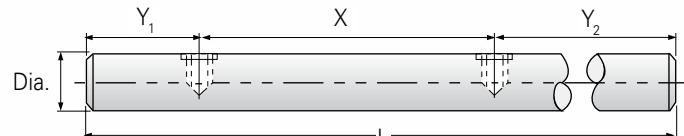

## PRECISION HARDENED GROUND LINEAR SHAFTING

### NON PRE-DRILLED SHAFTING

**FAX CUSTOMER SERVICE AT: (216) 271-7020** with a copy of your drawing or select a template from the following pages that best matches your application requirements.

1. Fill in all available data with tolerance in metric units.
2. If a specification is not on the template, add the applicable dimensions and tolerances desired.
3. If a specification is not required but is on the template, draw a line through it, and mark the item description with N/A.
4. Include additional notes to the template to aid in quoting and manufacturing.

For questions or help in selecting the best solution for your application requirements, please complete the application data sheet on page 47 and fax it to (216) 271-7020 or email to [sales@nookind.com](mailto:sales@nookind.com).

Nook Industries, Inc. • 4950 East 49th Street, Cleveland, Ohio 44125-1016

## UNIT CONVERSION

ENGLISH TO METRIC		METRIC TO ENGLISH	
Length	Torque	Length	Torque
1 ft = 304.8 mm	1 lb·ft = .001356 kN·m	1 mm = .00328 ft	1 kN·m = 737.3 lb·ft
1 ft = .3048 m	1 lb·ft = 1.356 N·m	1 m = 3.28 ft	1 N·m = .737 lb·ft
1 ft = .0003048 km	1 lb·ft = 135.6 N·cm	1 km = 3821 ft	1 N·cm = .00737 lb·ft
1 in = 25400 m	1 lb·ft = 1356 N·mm	1 m = .0000394 in	1 N·mm = .000737 lb·ft
1 in = 25.4 mm	1 lb·ft = .1383 kgf·m	1 mm = .03937 in	1 kgf·m = 7.23 lb·ft
1 in = .0254 m	1 lb·in = .000113 k-m	1 m = 39.37 in	1 kN·m = 8847.2 lb·in
